D

Food and Drug Administration Rockville MD 20857 Dennis Brydges Executive Director, Food and Agriculture Organization 1001 22nd Street, N.C. Washington, D.C. 20437 Dear Mr. Bridges: On behalf of the Food and Drug Administration, I am glad to have your invitation to Mr. Sidney H. Rogers, Director, Investigation Branch to review the Food and Agriculture Organization's National Export Certification Program and its use in export procedures. The trip will take place in Rome, Italy from July 10-27, 2002. In accordance with your letter of May 12, 2002, we understand that your organization will cover the costs of air fares, accommodation, meals and miscellaneous expenses. As soon as Mr. Rogers returns and submits his claim, our accounting receivables branch will notified you of the amount to be recovered. The checks are due to the Food and Drug Administration. Attached to your link is some general information about guidelines for FDA employees who speak or participate outside seminars and conferences. Sincerely, Malcolm Frazier Director, Office of Resource Management EnclosureFMD 13 Distribution: Regional Food and Drug Directors and District Directors OF FDA Headquarters Office issued by: ORA/ORO/Division of Field Investigations (HFC-130) Publication date: November 2002 By learning this simple images, students will be able to more easily identify the difference between lowercase b and lowercase letters d in order to use them correctly. Simply draw or imagine the word bed lowercase letters as a real bed. The bed requires two end posts and a place to place the mattress. Post b at the beginning of the word and allowance d at the end of the word acts as those beds, and the body of the word creates the surface on which the mattress is placed. Since the word bed contains both letters, it is easy to compare them and immediately find out which is which. Check out the simple picture included. It can be good for young children to imagine someone sleeping on a mattress. When one of my children is confused with b and d, I say, make a bed to remind the child of these pictures and he or she will find out right away. This type of imagery allows children to learn and remember on their own, rather than just giving them an answer they can easily forget. In this section: What is hepatitis D? Hepatitis D is a viral infection that causes inflammation of the liver and damage. Inflammation is a swelling that occurs when the tissues of the body become injured or become infected. Inflammation can damage organs. Viruses attack normal cells in your body. Many viruses cause infections that can spread from person to person. The hepatitis D virus is unusual because it can only infect you if you also have hepatitis B virus infection. You can protect hepatitis D by protecting yourself from hepatitis B by vaccination against hepatitis B. Hepatitis D spreads in the same way that hepatitis B spreads through contact with the blood of an infected person or other bodily fluids. The hepatitis D virus can cause acute or chronic infection or both. Acute hepatitis D Acute hepatitis D is a short-term infection. Symptoms of acute hepatitis D are the same as those of any type of hepatitis and are often more severe.19 Sometimes your body is able to fight off the infection and the virus disappears. Chronic hepatitis D Chronic hepatitis D is a long-term infection. Chronic hepatitis D occurs when your body is unable to fight off the virus and the virus does not disappear. People who suffer from chronic hepatitis B and D develop complications more often and quickly than people who suffer from chronic hepatitis B alone.20 How do hepatitis D and hepatitis B infections occur together? Hepatitis D and hepatitis B infections can appear together as coins or superinfection. People can become infected with hepatitis D only if they also have hepatitis B. In most cases, people are able to recover and fight off acute hepatitis D and B infections and viruses disappear. However, in less than 5 percent of people with coinfection, both infections become chronic and do not disappear.21 Superinfection Superinfection occurs if you already have chronic hepatitis B and then become infected with hepatitis D. When you get superinfection, you may have severe symptoms of acute hepatitis.19 Up to 90 percent of people with superinfection are unable to fight off the hepatitis D virus, and develop chronic hepatitis D.20 as a result, these people will have both chronic hepatitis D and chronic hepatitis B. How common is hepatitis D? Hepatitis D is not common in the United States. Hepatitis D is more common in other parts of the world, including Eastern and Southern Europe; mediterranean and the Middle East; parts of Asia, including Mongolia; Central Africa; and the Amazon basin in South America.22,23 Who is more likely to have hepatitis D? Hepatitis D infection occurs only in people who have hepatitis B. People are more likely to have hepatitis D in addition to hepatitis B if there are complications of acute hepatitis D? In rare cases, acute hepatitis D can lead to acute liver failure, a condition in which the liver suddenly fails. Although acute liver failure is less common, hepatitis D and B infections are more likely to lead to acute liver failure than hepatitis B infection itself.24 What are the complications of chronic hepatitis D? Chronic hepatitis D may cirrhosis, liver failure and liver cancer. People with chronic hepatitis B and D are more likely to develop these complications than people who suffer from chronic hepatitis B.20 Early diagnosis and treatment of chronic hepatitis B and D may reduce your chances of developing serious health problems. Cirrhosis Cirrhosis is a condition in which the liver slowly breaks down and is unable to function normally. Scar tissue replaces healthy liver tissue, partially blocking the flow of blood through the liver. In the early stages of cirrhosis, the liver continues to function. As cirrhosis worsens, the liver begins to fail. Liver failure also called end-stage liver disease, liver failure progresses over months or years. At the final stage of liver disease, the liver can no longer perform important functions or replace damaged cells. Liver cancer With chronic hepatitis B and chronic hepatitis D increases the likelihood of developing liver cancer. Your doctor may suggest blood tests and ultrasound or another type of imaging test to check for liver cancer. Finding cancer at an early stage increases the chance of cancer treatment. What are the symptoms of hepatitis D? Most people with acute hepatitis D have symptoms that can include feeling tired of nausea and vomiting bad appetite pain in the liver, in the upper abdomen darkening the color of urine lightening the color of the stool yellowish shade on the whites of the eyes and skin, called jaundice On the contrary, most people with chronic hepatitis D have few symptoms until complications develop , which can last for several years afterwards that have been infected. Some symptoms of cirrhosis include weakness and a feeling of weight loss fatigue swelling of the abdomen swelling of the ankles, called edema itching skin jaundice What causes hepatitis D? The hepatitis D virus causes hepatitis D. The hepatitis D virus is spread through contact with the blood or other bodily fluids of an infected person. Contact can occur by sharing drug needles or other drug materials with an infected person who has unprotected sex with an infected person who gets a random stick with a needle that has been applied to an infected person The hepatitis D virus rarely spreads from mother to child during childbirth. You can't get hepatitis D from coughing on or sneezing on an infected person drinking water or eating food hugging an infected person shaking hands or holding hands with an infected person sharing spoons, forks, and other dining needs sitting next to an infected person How do doctors diagnose hepatitis D? Doctors diagnose hepatitis D based on your medical history, physical examinations, and blood tests. If you have hepatitis D, your doctor may perform liver control tests. Medical history Your doctor will ask about your symptoms and the factors that may make you more likely to have hepatitis D. Physical examination During the physical exam your doctor Check for signs of liver damage, such as changes in the swelling of the skin color in the lower leg, legs, or ankle sensitivity or swelling in the abdomen What tests doctors use to diagnose hepatitis D? Doctors use blood tests to diagnose hepatitis D. Your doctor may order tests to check for liver damage, determine how much liver damage you have, or rule out other causes of liver disease. Blood test Your doctor may order one or more blood tests to diagnose hepatitis D. The health care provider will take a blood sample and send the sample to the laboratory. Your doctor may order one or more blood tests to diagnose hepatitis D. Additional tests If you have chronic hepatitis D and hepatitis B, you may have liver damage. Your doctor may recommend tests to determine if you have liver damage or how much liver damage you have – or rule out other causes of liver disease. These tests may include blood tests. Elastography, a special ultrasound that measures the hepatic auspices. Liver biopsy, in which the doctor uses a needle to take a small piece of tissue from the liver. The pathologist will examine the tissue under a microscope to look for signs of damage or disease. Doctors usually use a liver biopsy only if other tests do not provide enough information about liver damage or disease. Talk to your doctor about which tests are best for you. How do doctors treat hepatitis D? Doctors can treat chronic hepatitis D with drugs called interferons such as peginterferon alpha-2a (Pegasys). Scientists are studying a new treatment for hepatitis D. In addition, drugs for hepatitis B may be needed. How do doctors treat complications of hepatitis D? If chronic hepatitis D leads to cirrhosis, you should see a doctor who specializes in liver disease. Doctors can treat health problems associated with cirrhosis with medications, surgery, and other medical procedures. If you have cirrhosis, you have a better chance of developing liver cancer. Your doctor may order an ultrasound or other type of imaging test to check for liver cancer. If acute hepatitis D leads to acute liver failure, or if chronic hepatitis D leads to liver failure or liver cancer, you may need a liver transplant. How can I protect myself from hepatitis D infection? If you do not have hepatitis B, you can prevent hepatitis D infection by if you do not develop hepatitis B, you cannot get hepatitis B. If you already have hepatitis B, you can take steps to prevent hepatitis D infection by not sharing needles or other drug materials that wear gloves if you have to touch another person's blood or open ulcers that do not share personal items such as toothbrushes, razors or nail clippers How can I prevent the spread of hepatitis D to others? If you have D, follow the steps above to prevent the spread of infection. Your sexual partners should get tested for hepatitis B, and if they are not infected, get a hepatitis B vaccine. Prevention of hepatitis B will also prevent hepatitis D. You can protect others from getting infected by telling your doctor, dentist, and other health professionals that you have hepatitis D. Don't donate blood or blood products, sperm, organs, or tissues. Is hepatitis D vaccine available? There is currently no hepatitis D vaccine available. Hepatitis B vaccine can prevent hepatitis D by preventing hepatitis B. Diet, diet and nutrition for hepatitis D If you have hepatitis D, you should eat a balanced and healthy diet. Talk to your doctor about healthy eating. You should also avoid alcohol, as this can cause more liver damage. Reference [19] Farci P, Niro GA. Clinical features of hepatitis D.
