Lien Chieu, Thanh Khe and Hai Chau districts: Cloudy, scattered rain, cold weather.- Temperature: 20-23 degrees.- Wind: north to northwest, level 2-3.- Humidity: 80-90%. Hoang Sa-Tp Da Nang Island District: Cloudy, rainy in some places.- Temperature: 22-27 degrees.- Wind: north to northeast, level 3-4.- Humidity: 70-95%. Cold air intensified and cold Today, the strong cold air division reportedly continued to move south. Forecast: Today (7/1), this strong cold air division will strengthen and affect the Tonkin Mountains, afternoon and evening affecting other parts of the north; then it will affect North Central, Central Central and some parts of South Central Bô.Do the effect of cold air, so from tonight the area with rain, where the rain is moderate, heavy rain, turns to cold, the north has a cool, cool place. On land, north to northeast winds are 3rd degree, coastal level 4-5. The sea has scattered rain, strong northeast winds of 7, level 9 shock, sea waves 3.0-5.0 m high, strong sea. The waters of the Paracel Islands have strong northeast wind level 7, there are level 8 locations, level 10 jerks, sea waves 5.0-7.0 m high, strong seas. The lowest temperature in this period in the provinces and cities of the region is as follows: + Quang Binh Province: 11-13 degrees, Mountainous areas where 9-11 degrees.+ Quang Three provinces: 12-14 degrees, mountainous areas where 10-12 degrees.+ Thua Thien Hue Province: 13-15 degrees, mountainous areas where 10-12 degrees.+ Provinces and cities from Da Nang to Quang Ngai: 16-18 degrees. Check out the latest Da Nang weather information within an hour. Update other weather forecasts tomorrow, 3 days, 10 days to be the most accurate in Da Nang. See weather information for months and climate change in Da Nang on: rain, wind, storm, temperature, UV radiation... The climate situation and extreme weather events in Da Nang City are found in typical tropical monsoon climates, high temperatures and small fluctuations. Da Nang climate is the transition between the subtropical climate in the north and tropical savannahs in the south, with the dominant tropical climate in the south. There are two different seasons each year: the rainy season from September to December and the dry season from January to August, sometimes with winter chills, but not bold and not lasting. - Average annual temperature: 25.8 °C - June, July, 8 warmest with an average of 28-30 °C - December, January, 2 coldest with an average of 18-23 °C - Average annual humidity 83.4%. - Heavy rain in September, October, November. Sunny around May, June, July, every year Da Nang is directly affected by one to two typhoons or tropical depressions. According to the National Center for Hydro-Meteorological Forecasting, the UV index in Hanoi, Da Nang remains at a very high level of damage. Meanwhile, according to forecasts by Weather Online (UK), the UV index in Da Nang from July 10 to July 14 always fluctuates to 10-11. The World Health Organization (WHO) has recommended that UV radiation be 8-10 if the sun for about 25 minutes can cause skin burns. When the UV index is 11 or higher, the risk of skin burns when exposed to the sun is about 10 minutes without protection. UV radiation at the age of 12 years is dangerous to health, especially for children. According to Dr. Luong Quang Shen, Deputy Head of The Department of Plastic Surgery, exposure to high intensity UV rays will lead to 2 consequences that are skin diseases and cosmetic effects. Common skin diseases in this case are skin cancer, acute dermatitis, allergies, rashes, water burns ... To a lighter extent, the skin when exposed to UV radiation will be molasses, darkening, aging skin, sagging ... According to Dr. Shen, the effect of UV exposure is cumulative, which will accumulate throughout life. Regardless of age or skin type, if exposed to UV radiation, there is a risk of developing skin cancer. Da Nang weather forecast information today Not only Da Nang, but the central province in general are currently affected by the southeastern edge of the western hot depression combined with the effect of drying weather heat lasts for several days. In particular, the provinces from Thanh Hoa to Thua Thien Hue continue to be hot sun, there are hot spots with the highest temperatures common 35-37 degrees, there are places above 37 degrees. The lowest relative humidity of the day is a normal 50-60%. Temperature above 35 degrees from 11 to 16 hours. The heat wave in the central part is likely to last for several days. Forecast: Today (7/1), this strong cold air division will strengthen and affect the Tonkin Mountains, afternoon and evening affecting other parts of the north; then it will affect North Central, Central Central and some parts of South Central Bô.Do the effect of cold air, so from tonight the area with rain, where the rain is moderate, heavy rain, turns to cold, the north has a cool, cool place. See weather information for months and climate change in Da Nang on: rain, sun, wind, storms, temperature, UV rays... The climate situation and extreme weather events in Da Nang City are found in typical tropical monsaite climates, high temperatures and small fluctuations. Da Nang climate is the transition between the subtropical climate in the north and tropical savannahs in the south, with the dominant tropical climate in the south. There are two different seasons each year: the rainy season from September to December and the dry season from January to August, sometimes with winter chills, but not bold and not lasting. - Average annual temperature: 25.8 °C - June, July, 8 warmest with an average of 28-30 °C - December, January, 2 coldest with an average of 18-23 °C - Average annual humidity 83.4%. - Heavy rain in September, October, November. Sunny around May, June, July, every year Da Nang is directly affected by one to two typhoons or tropical depressions. According to the National Center for Hydro-Meteorological Forecasting, the UV index in Hanoi, Da Nang remains at a very high level of damage. Meanwhile, according to forecasts by Weather Online (UK), the UV index in Da Nang from July 10 to July 14 always fluctuates to 10-11. The World Health Organization (WHO) has recommended that UV radiation be 8-10 if the sun for about 25 minutes can cause skin burns. When the UV index is 11 or higher, the risk of skin burns when exposed to the sun is about 10 minutes without protection. UV radiation at the age of 12 years is dangerous to health, especially for children. According to Dr. Luong Quang Shen, Deputy Head of The Department of Plastic Surgery, exposure to high intensity UV rays will lead to 2 consequences that are skin diseases and cosmetic effects. Common skin diseases in this case are skin cancer, acute dermatitis, allergies, rashes, water burns ... To a lighter extent, the skin when exposed to UV radiation will be molasses, darkening, aging skin, sagging ... According to Dr. Shen, the effects exposure to UV radiation is cumulative, which will accumulate throughout life. Regardless of age or skin type, if exposed to UV radiation, there is a risk of developing skin cancer.
