Mitosis is the duplication and division of a eukaryotic cell's nucleus and nuclear material (DNA). The stages of mitosis are: [interphase (cell when it does not undergo mitosis, but DNA is replicated)], prophase, metaphase, anaphase, and telophase. Terms to use: Anafas - the phase of mitosis in which chromosomes begin to separate. Centrioles - paired cylindrical organelles, arranged at right angles to each other, located in the middle of a microtubules. Centromeres - a centromere is the region of a nuclear chromosome - microfibers attach to the centromere under mitosis. Chromosomes - structures in the nucleus that contain DNA molecules containing the genes. Interphase - the phase of a cell's life cycle in which DNA is replicated. Microtubules - small filaments (about 25 nanometers in diameter) that are active in mitosis. Metaphase - the phase of mitosis in which chromosomes line up at the equator (the central plane) in the cell. Prophase - phase of mitosis in which the duplicate chromosomes condense, the core envelope dissolves, and centrioles divide and move to opposite ends of the cell. Telophase - the last phase of mitosis, when chromosomes migrate to opposite ends of the cell, two new nuclear envelope sform, and chromosomes uncoil.
