Sentry safe manual unlock

But what's the quick question to ask? Write them down here, and we'll be back with you soon during business hours. Urgent investigation or a complex question? Please call us at 63279051, we are more than happy to help you by phone. 1 Turn the key to Unlock if your safe has a double lock function. Some electronic safes have a second lock that stores safe seal even when the combination code is entered correctly. If the safe has a keyhole, paste the key and turn it clockwise to Unlock. After turning the key, remove it from the safe. [1] Keep the keys in a safe place, such as a closet or drawer, so that you are not in the wrong place. 2 Look for a combination in the safe guide. Check the owner's manual for a small card that has the safe information printed. Find the 5-digit number marked as Factory Code to know the combination to unlock your safe. Write down the combination or commit it to memory so that you can open the safe later. [2] At the end of the manuscript, your card is usually removable so that you can save it. Do not throw away the card, because it has important information about the serial and model number that you may need in the future if you forget your secret code. 3 Enter the code on the safe keyboard. Press the safe number keys to unlock the safe. If you accidentally entered an incorrect number, wait a few seconds to set the code safely before starting again. When you enter the correct code, the light above the keyboard will turn green. [3] If you enter the incorrect passcode too many times, the safe time may be time-out and prevent it from being unlocked for a specified time. If the keyboard or light doesn't work when you enter the code, you might need to change the batteries on the side of the keyboard. Tip: Even if you have programmed the custom code, the factory code printed in the guide will work to open the safe. 4 Pull the knob down on the safe within 4 seconds of entering the code. When you enter the code and the light turns green, pull the knob next to the keyboard and turn it down to undo the screws. If you do not open the door in 4 seconds, the lock will re-enter and you will need to re-enter the code. [4] Enter the combination and pull the handle down until the door is open to unlock it. 1 Look for the combination attached to the safe user manual. For an attached card with safe information, see the instructions manual at the end. At the bottom of the card, find a set of 3 numbers separated by hyphens that you will use as a combination. Memorize the combination or remove the card so that you can still get into the safe if you forgot. [5] For example, your combination may look like 53-17-24. Store safe information where you will not forget to be able to access it later. 2 Turn the wheel so that the arrow is pointing to 0. Check that the handle is horizontal in the safe, i.e. it is in a locked position. Turn the dial at the front of the safe until a small arrow at the top is reflected in the 0 printed on it. Always start with position 0 in the safe, or it may not unlock when you dial a number with a code. [6] 3 Double-turn the wheel clockwise through the first number of the combination. When you're ready to open the safe, turn the dial clockwise with the first number. Complete 2 full turns around the dial, so you pass the number you need twice. If you don't immediately connect dialing twice, the safe won't open when you're done debug. [7] If the safe is a combination of left and right style, turn the wheel counterclockwise. 4 Stop the first combination number for the third time. After twice passing the first number, slowly turn the wheel so that the mustache over the number you need lines up with the arrow. Be careful not to turn the wheel, or you may need to start entering the combination from the beginning. [8] 5 Before stopping the number, turn the wheel counterclockwise once. Turn the wheel counterclockwise when you're ready to put the second number. Pass the number once and make a complete revolution around the dial. When you're approaching a number a second time, slow down and stop on it so that the arrow is pointing up with a step above it. [9] Turn the wheel clockwise if you have a safe in the left and right style. By turning the lock, make sure that you slow down so that you can get the number so that it fits perfectly, or the safe may not open. 6 Turn the wheel clockwise directly to the last number to unlock it. Turn the wheel again clockwise and stop as soon as you reach the last number of the combination. When you have finished entering the combination, remove the handle to unlock the secure door. If you type the combination correctly, it will easily pull back and open, but the handle will not move if you made a mistake. [10] If you have a left-left safe, insert the final number, turn the wheel counterclockwise. Tip: Practice placing the combination in the lock until the door is open so you can get used to entering it. 1 Find your safe model and serial numbers. If you have access to the instruction manual, look at the card at the back to find all the numbers. If you don't have a handball or lose your card with information, look around the body of the safe next to the hinge or on the side to find the numbers printed on it. Write down the numbers you find so you can enter the information. [11] 2 Enter your information on the SentrySafe website. Provide the recovery site model number, serial number, and email address. If When you change a double lock key, you may also need a key number that is printed on the key or lock. When entering information, before you click the Continue next steps button at the bottom of the page, confirm that you wrote everything correctly. [12] Tip: If you can't find the codes or the website doesn't work, you can call customer service line 1-800-828-1438 Monday to Friday 7:30 - 5:00 PM CST. [13] 3 Pay for replacement or processing fees. The lost combination has a \$30 USD processing fee, while replacement keys cost \$30 or \$60 USD for a set of 2 or 4, respectively. Provide your credit card information to the website and confirm that everything is written correctly. When you are finished sending a payment and completing the process, click the Submit button. [14] You can also be taxed depending on where you live. 4 Wait 7-10 days for your replacements to arrive. Whether you ordered new keys or needed to restore the combination, SentrySafe will take about 7-10 businesses to complete the request. The company will confirm the model and serial numbers and send you an email with a factory combination or a set of new keys in the mail. [15] You can also order an accelerated set of keys that will be delivered the next day, but it costs \$50 USD for a set of 2. If you need to immediately access the safe, you may need to select a lock if you can. Ask a question Thank you! Thanks!
