If you have any questions about the medicines you are taking, ask your doctor, nurse or pharmacist. Copyright 1996-2020 Cerner Multum, Inc. Version: 16.01. Revision date: 1.22.2020. Health information What happens if I miss a dose? As this medicine is used for pain, you are unlikely to miss a dose. Skip the missed dose when it is almost time to take your next dose. Do not use two doses at the same time. What happens if I overdose? Seek emergency medical attention or call the Poison Helpline at 1-800-222-1222. Overdose of acetaminophen and hydrocodone can be fatal. The first signs of acetaminophen overdose are loss of appetite, nausea, vomiting, abdominal pain, sweating and confusion or weakness. Later symptoms may include upper abdominal pain, dark urine and yellowing of the skin or whites of the eyes. An overdose can also cause severe muscle weakness, exactly pupils, very slow breathing, extreme drowsiness or coma. What should I avoid while taking acetaminophen and hydrocodone? Avoid driving or handling machines until you know how this medicine affects you. Dizziness or drowsiness may cause falls, accidents or serious injuries. Don't drink alcohol. Dangerous side effects or death may occur. Talk to your doctor or pharmacist (sometimes shortened as APAP) before using other medicines containing acetaminophen. The combination of certain medicines can be fatal. What other medicines affect acetaminophen and hydrocodone? If you start or stop taking certain other medicines, you may experience breathing problems or withdrawal symptoms. Tell your doctor if you are also taking an antibiotic, antifungal medicines, medicines for heart or blood pressure, medicines for seizures or a medicine to treat HIV or hepatitis C. Make sure your doctor knows if you are also using: cold or allergy medications, bronchodilator asthma/COPD medications, or diuretic (water pills); medicines for motion sickness, irritable bowel syndrome or overactive bladder; other drugs shall be used as an opioid pain treatment or a prescription cough medicine; sedative such as Valium--diazepam, alprazolam, lorazepam, Xanax, Klonopin, Versed, and others; medicines that make you feel sleepy or slow down

your breathing, sleeping pills, muscle breakdown, medicines to treat mood disorders or mental illness. medicines that affect serotonin levels in your body - stimulant, or medicine used to treat depression, Parkinson’s disease, migraine headache, serious infections, or nausea and vomiting. This list is incomplete. Other medicines may affect acetaminophen and hydrocodone, including prescription and over-the-counter medicines, vitamins, and herbal products. Not all possible interactions are listed here. Where can I get more information? Your doctor or pharmacist may provide more information about acetaminophen and hydrocodone. Keep this and all other medicines out of the reach of children, never share your medicines with others and use this medicine only for the intended indication. All efforts are to ensure that Cerner Multum, Inc. (‘Multum’), the information provided is accurate, up-to-date and complete, but no warrant has been given. Percocet is a powerful opioid painkiller used to treat moderate to severe pain. Percocet is classified as a List II controlled substance by the United States Drug Enforcement Administration, which means it has the potential for abuse, and is only available on prescription. Percocet is a combination of the opioid element oxycodone and acetaminophen, which is the active substance in Tylenol. People often don't know what Percocet looks like, whether there is a yellow Percocet, and generally how to identify the drug. What does Percocet look like? People often don't know what Percocet looks like and, for example, they may ask if there is a yellow Percocet in addition to white. First, yellow Percocet is common. Usually, the highest dose is yellow Percocet, and is often elliptical or oval in shape. If Percocet is generic, it can also be yellow. In general, yellow Percocet is a 10mg/325mg prescription, regardless of whether it is generic or brand name. Lower doses of Percocet tend to be white and round. It can be printed on Percocet if it’s a brand name, and it can also be a number that shows how much oxycodone it contains. Some brand name Percocet pills may also be blue and round. It is important to be aware, however, that what you think is a yellow Percocet or other type of Percocet may be something else. In Georgia, for example, overdoses and visits spiked due to people buying what they thought to be yellow Percocet, but ended up being strong and dangerous fake pills. Investigators reported the yellow Percocet people thought they bought was not actually a prescription drug, and a public safety alert was issued. This has been quite common in recent years, many people think they buy oxycodone only to find out that it is fentanyl or other potentially lethal drugs. The risk of misidentified yellow Percocet and white Percocet is just one of many reasons why you should never try to use or buy prescription painkillers illegally. Percocet Doses Counting Percocet doses, the first number represents oxycodone present and the second is the amount of acetaminophen present. The doses of Percocet are as follows: Oxycodone hydrochloride 2.5 mg/325 mg: This is the lowest dose of Percocet. Oxycodone hydrochloride 5 mg/325 mg: This is the next dose of white or yellow Percocet. Acetaminophen is the same dose that is a step below. Oxycodone hydrochloride 7.5 mg/325 mg: This is one of the strongest doses of Percocet. Oxycodone hydrochloride 10 mg/325 mg: This is the highest dose of oxycodone available in Percocet brand name recipes or generic drugs. People take Percocet to relieve moderate to severe pain and should never exceed the dose prescribed by their doctor or pharmacist. Usually a dose of Percocet is to take one to two tablets every six hours as needed. According to the drug guidelines, 2.5 mg tablets, the usual dose is two tablets every six hours as necessary. For 5 mg tablets, the usual dose is one tablet every six hours. People should be careful not only because of oxycodone in this medicine, but also because of acetaminophen, which can cause liver damage. Percocet abuse When someone takes Percocet, it changes the way their brain and body perceive pain. Percocet's opioid component binds to central nervous system opioid receptors, and in the process, the brain releases dopamine flooding. This dopamine makes your pain threshold higher, not actually eliminating pain, and feelings of well-being can also accompany that feeling. If you are taking Percocet, there is a possible addiction and addiction, as well as other opioids. As you take Percocet, your brain begins to feel as if it is necessary to continue its use in order to keep stimulating your reward system and releasing dopamine. This is why addiction can develop rapidly with percocet and other opioids. If you or a loved one is struggling with Percocet abuse we are here to help.
