## Pharma small cap 2020 explodes

Although markets have receded so far in September, many see this as a technical correction as markets were very hot in a very strong August. Market corrections are made on a regular basis and this should not destag investors from buying the dip or even pulling out their money. Despite the backlash, one sector wants to take off in the second half of this year and even in 2020. The health sector, especially some biotech kits, is expected to explode in 2021. The iShares Nasdaq Biotechnology ETF (NASDAQ: IBB) has risen just 7% in the past 52 weeks and 26% in the past 52 weeks. There have been a few breakout companies as a result of the coronavirus pandemic, but other catalysts will play into the expected gains as well. Virtually every company trying to do almost anything about COVID-19 has seen huge profits. However, other big winners in the industry are not tied to the pandemic and are likely to have more coming for the rest of the year and even next year. Keep in mind that biotechs offer great risk, but great rewards as well. These are seen by some speculative companies on the market because a clinical trial could be either a huge sunk cost or the next blockbuster drug. 24/7 Wall St. has compiled a list of some biotech companies that will see huge gains in the coming months. Keep in mind that a single analyst call will ever be used as the only reason to buy or sell a stock, but will not provide insight when doing research on these unique stocks. Alexion Pharmaceuticals Despite its history of not pleasant investors, there are a lot of positive trends currently going on at Alexion Pharmaceuticals Inc. (NASDAQ: ALXN) that could be viewed favorably in the coming months. Low valuations, steady growth, beating income, lifting impersonators, activist investors, loose merger hopes for an expanded and diversified drug pipeline and higher analyst price targets just might all add up to something for longer-term investors. Activist company Elliott Management noted rumors of an Amgen deal and said that the best return for shareholders would be a acquisition of the entire company. While an acquisition may bring upside, there may be concerns about slower growth derived from the history of underwhelming acquisitions. In short, Amgen may not want to pay a premium to a company that hasn't done much work on its own expensive business-making in recent years. While most investors like to hear that a potential acquisition may be the case, the reality is that investors can never view the company solely because they could see an acquisition down the road. SVB Leerink has an outperform rating and a \$163 price target, the highest target on Wall Street. Other notable analysts made similar calls. Raymond James a better performing rating with a \$151 price target, and SunTrust Banks reiterates a Buy rating with a \$155 price price Alexion Pharmaceuticals stock closed Wednesday at \$108.28 a share, in a 52-week range of \$72.67 to \$121.50. The consensus price target is \$141.32. Biogen Inc. (NASDAQ: BIIB) has been in range for five years and has a market cap of \$43 billion. The consensus price target of \$305.39 means it says over 10% upward from current prices. While Biogen has led the way in multiple sclerosis treatments for years, the big upside catalyst, once it gets approved, will be to treat Alzheimer's disease, as there are no current drugs approved by the FDA that actually help treat or slow its progression. This is far from a certain outcome here, and this once chose as dead upon arrival, but any Alzheimer's disease-approved treatment by the FDA is likely to be guaranteed to unspeakable additional billions in sales. 14 October, 2020, 01.31 PM ISTThe S&P 500 index trading up 0.12 percent at 14635.19.25 Nov, 2020, 02.51 PM ISTThe index was trading up 1.04 percent at 16377.3.29 on Oct. 2020, 02.44 PM ISTThe index is trading down 0.95 percent at 14833.75.07 Nov, 2020, 05.57 PM ISTMarket volatility has fallen significantly, with the INDIA VIX coming off about 17.19 percent at 20.50 levels on a weekly basis. The following week, Nifty will face resistance at 12,350 and 12,500 levels, while support will come to 12,150 and 11,950 levels. Trading is expected to stay broader in the coming week.23 Nov, 2020, 02.12 PM ISTThe index is trading up 1.3 percent at 16392.93.07 October, 2020, 01.03 PM ISTThe S&P 500 index was down 0.15 percent at 15,087.48.30 Nov, 2020, 10.19 AM IST Foreign stocks performed well, especially in managed developed markets. While the easy money policy is fueling a rally in stock markets abroad, we may be reaching near bubble valuations, especially in the tech sector in the U.S., said Deepak Jasani, HDFC Securities.10 Nov, 2020, 09.50 ISTWith the Sensex and Nifty at all-time highs, mid- and small-shares appear better poised to perform.15 Oct, 2020, 08.26 PM ISTDomestic fund are managers going to favor the larger IT companies'22 Oct , 2020, 02.23 PM ISTThe S&P 500 index was up 0.35 percent at 14952.22.13 October, 2020, 09.37 AM ISTSun Pharmaceutical Industries Ltd., registered in 1993, a large cap company (having a market cap of Rs 123301.82 Crore) operating in the pharmaceutical sector.11 September, 2020, 02.07 PM ISTThe BSE SmallCap index is trading up 0.35 percent at 14,533.95. in 2020 could be a huge year for stocks, according to Matt McCall... but there is a sector that sees soaring above all else \*\*\* The Digest holiday schedule Please note we will take a break from Digest tomorrow and Christmas to spend time with loved ones. We'll continue on the 26th. Merry Christmas and happy holidays to all! If you want to make real money next year, you can investments in this This quote is from Matt McCall. For all newer Digest readers less familiar with Matt, he is one of the most successful analysts in InvestorPlace's history. Over the past 10 years, it has found 16 recommendations that have gained more than 1,000%, and more than 200 stocks that have increased between 100% and 999%. Given this past, his description of a sector is about to make real money by taking an added gravitas. So, what are you talking about? I'll let Matt write it down himself. This comes from his just-released issue of Early Stage Investor: At Early Stage Investor, my goal is to raise money for risk style investing. My goal is to get you into the best small companies in the world, which are five times, 10-fold, and even 20-fold. Investing in hyper-growth-capable industries is a critical part of achieving this goal. So forecasting and forecasting the giant industries of the future is a big part of my job. You could say I try to predict the future every single day. That's why I feel comfortable making a great 2020 prediction on my own... one I think that if you make a lot of money if you act on it .... there is one sector that is predicted to outperform all others

in 2020. My year-end prediction? 2020 will be the year of Biotech. In today's Digest, let's dig into the back wind that Matt sees in this sector. As he tells readers, in the next decade we will witness improvements that will only imagine the wildest of our dreams... from a possible cure for cancer to the drug insanity of artificial intelligence, devices that track our vital signs 7 hours a week. The future of health care will begin in 2020. Let's find out why today. Why 2020 will be the year biotech Matt begins looking at the biotech industry from a technical point of view, side by side with that of the tech sector. You know, technology stocks are one of the best in a decade. Since April 21, 2015, the Nasdaq 100 Index - which consists of Nasdaq's largest non-financial U.S. stocks - has risen 93% and is trading at its all-time high. Biotech kits tell a very different story. Since April 21, 2015, the Nasdaq Biotech Index has fallen 1%. Wider technology has outperformed biotechnology by more than 92 times. Matt: Biotech investors haven't been rewarded in the last five years, but that's about to change... .... The maps are telling us something important right now. The recent pricing of biotech stocks is significant, as we may have already seen control swing in favour of bulls. Since late September, the Nasdaq Biotech Index has risen 20.9%, more than double the Nasdaq 100 yield. Matt goes on to tell readers that one of his favorite chart patterns is a long-term outbreak that occurs after years of consolidation. And that's exactly what's happening in the Nasdaq Biotech Index. After a year, Action, the maps suggest, is set to continue until 2020 - giving new highs in the coming months. From a technical point of view, the next eruption would be a rally of 4,165, an all-time high set in July 2015. Matt sums up this point by comparing the lateral diagram of biotechnology over the past 5 years with a coiled spring tightly compressed. When it's finally released, Matt expects the pressure to explode, resulting in a multi-year bull. Big money going on in biotech We can identify the second sign of bullishness in the biotech sector following the money flow. Matt said that in the first nine months of 2019, the biotech and pharmaceutical sectors achieved \$195 billion in mergers and acquisitions. Without a full year total, it was already the second largest amount ever, behind only 2015, when the index reached an all-time high. Why are we seeing so much activity? From Matt: ... large drugs, which are typically used by buyers, are increasingly desperate for new sources of income. For example, pharmaceutical giants Merck and Pfizer are expected to generate \$46 billion and \$51 billion in revenue this year, respectively. It's going to be hard to increase annual revenue by 5%, let's just say 10%... One way to boost revenue from double-digit growth is to buy a company a potential blockbuster product. Matt then highlights a number of M&A; The deals from 2019, including Bristol-Myers Squibb, Celgene, AbbVie, Allergan, Pfizer, and Merck, are completed .... investors were looking for very big deals in 2019 .... This upward potential is the reason why large pharmaceutical companies will buy smaller biotechnology in 2020 and beyond. On the tailwind of the presidential election Matt explains that the Trump re-election, which is currently what pundits suggest is generally bullish on biotechs. That said, it's a bit of a surrogate. That's because a democratic president has the potential to put a heavy strain on the sector. From Matt: ... most (democratic) leaders in the polls lean toward more regulation of drug companies, including biotechnology. For example, a win for Elizabeth Warren would hurt biotech stocks if she goes ahead with her Medicare for All plan and regulations on drug pricing. Trump's victory, on the other hand, would bring a huge rally in health care stocks, and biotechs would rise to new historic highs. I don't want to get into political debates, but I always share with you the results our stocks can produce. As we approach the election on 3 November, I will keep you informed of my opinion. While it's clearly too early for any meaningful prediction, for fun, below is that oddsmaker and gambling site, Bovada, sees the choice. For you, it is not better to probability of a Trump victory above the numbers above is 51.2%. The technological explosion behind biotech biotech In five years, biotech companies have poured billions into their quest to find the next blockbuster drug. Matt says that the prospects for breakthrough treatments in the 2020s have made him more excited about biotech kits than he has for many years. One of Matt's favorite subsectors in biotechnology is gene therapy. It already owns three of these shares in its early-stage investor portfolio. Matt: Two stories attract buyers of gene editing kits. First, the first reports out of Phase 1/2 trials have been better than expected. And the second is the stores we talked about. Specifically, gene therapy kits are purchased by major pharmaceutical companies. How can an investor play this game? The easiest way would be through a biotechnology ETF that would provide an investor with extensive exposure across the industry. An example is the iShares Nasdaq Biotechnology ETF, IBB. Includes heavyweights Amgen, Gilead, and Biogen, among others. The IBB shown below has more than doubled the number of S&P; P in the last three months. While IBB will give you great exposure to the largest biotechs, it is unlikely that the explosive gains Matt cited. This is because they usually come from much smaller biotechnology, which are not included in many of these large caps etf. These are the little companies the big boys buy out. To help Matt identify these minor biotechs via Early Stage Investor, click here. Either way, if you're not exposed to biotech, it's worth taking the time to give it a look. I give Matt the last word in summary why: The last biotech boom (2008-2015), the AMEX Biotech Index gained 777%. Investors smart enough to get into biotech stocks had the potential for life-changing gains. Exact Sciences (EXAS) soared to 54X, Regeneron Pharmaceuticals ran 34X, and Incyte (INCY) gained 31X. I think more biotech stocks are about to give investors another opportunity similarly huge - or even bigger - as they head into roaring 2020s. Good evening, Jeff Remsburg Remsburg.
