Here are a few similar options... Ball Python (super black morph) Corn snakes (any tesera)yes! A Mexican Black Kingsnake is the perfect reptile for you. Here's how to care for them: Hatchling baby - 10 -15 gallon long Juvenile - 20-30 gallon LongAdult - 30 - 40 gallon LongAs Snake Beding Snake Bed bedingRepti-Bark BeddingCok Husk bed repti-Kapetwspawspaper/paper toIsOu has many options for substrates, however, please do not use cedar bed. The oils in this material are toxic to all reptiles. Reptiles require a set of heat to self control their temperature temperature: 70 - 75 Fideal Ambient Temperature: 77 - 84 Fidal Hot End Temperature: 85-90 Funhealthy Low Temperature: 65 Funhealthy High Temperature: 95 Fmexican Black Kingsnakes Prefer moderate moisture. It is advisable that you place your water snake bowl on the fresh side of its enclosure and monitor its moisture rates to ensure it stays within the healthy range for the species. Ideal Humidity Range: 40 – 60% Do Not Allow Humidity Riding Above 75% (Except During Color)You can change the moisture of your Mexican Black envelope by simply increasing slits or decreasing bowl size. When your MBK enters its color period, increase moisture by moisture a paper towel or reptile mos and place it in one of the hidden ones. Replace each other until your snake completely snakes completely. Managing moisture with a Black Kingsnakes hydromexican thrives on proper-size muscles and rats. These snakes are typically furocious meals and rarely skip a meal. Frozen-Thawed muscles and rats are the safest and most humane feeder options for your MBK. Please make sure the food is well thawed and heated before eating. Always nourish your Black Mexicans with all zannig to help you disappear your chance bit during lunch. Buyers with baby snakes should be nurtured every 4 – 5 days while young children and adults can be nurtured every week. Sam's useful suggestions. The feeder size that you should offer is determined by the most inherent circumference of your snakes. Match that size to the inherent circumference of the feeder. Mexican Black Kingsnakes and most snakes are considered fairly low maintenance and difficult pets, however, like most animals, are sensitive to certain health complications. Most cases correct and adjust spouse with medical treatment. Here are the medical conditions that can affect MBKs: ImpactStuck ShedMiteseye InfectionSAbseesse of MouthRespiratwa Infection Rot Erica Mede, The history of the CVT Natural Mexican Black Wasnake , a subscription to the Common (East) wasnake, is a very popular snake in the reptile pet industry due to their beauty, modest size and rather tranquil temperament. This species is one of the first wasnakes to be broken regularly for the single purpose of pets! Mexican Black kingsnakes grow between 3 and 4 feet and often live 15-20 years in captivity and excellent care. Natives of the Stone, semi dessert and gray zone in Mexico went up in portions of this Arizona species showed adaptation of being an abystos navigator as well as an excellent swim. Despite popular beliefs, wasnakes don't immune to the artery of authentic Rattlesnakes but to resist the dilemmunification of it. Also, these snakes are not necessarily predatory in venom snakes. They are eating expense and will consume them when they are available but not looking for them out there. Feeding of wood, these snakes eat primarily on rods, snakes, eggs, and lizards. In captivity, these snakes are primarily miserable. He recommends that only pre-killing pre-killing as live priorities have the potential of serious wounds or killing captive snakes, especially those who don't live rushed. Variety is always encouraging. Feeder abols and chickens are available. Most people who turtle will have eggs at one point or another and what they can use if they are stored properly and the tortoise is healthy. Skilled button keepers on occasion have eggs as well. Hatchlings can be nourished every 5-7 days. Youth should offer daily meals 7-10 and adults nurture every 10-14 days. These snakes tend to go to food during falls and will become unused. Wild people keep people can ask for a fresh down or brumation period to stimulate an aptake again but most will start eating longer without a problem. Locked adults are easily kept in a 20-30 gallon glass aquarium with a screen cover. The larger to close the best, a 4 foot snake will likely feel more of the roof of a 40 gallon reservoir tank. Some people even use modified lower boxes to keep these snakes especially attractive and wild specimens capable of Flight. Hatchlings can be kept within 10 gallon aquarium. As these snakes are admired in surfing under subtract and climbing on low branches it is advisable to have a little more height of a lock. Substrate Substrate should ideally be easy to clean. Newspapers, artificial clumps such as Reptile Carpet, and paper towels are favorites for buyers and new ones to control fecal production. Most established people can keep happy on the highest bed or as long as it is frequently injudged and changed every 7-14 days. Never use pine rods or yield as the aromatic oils can cause irritation and respiratory problems in your snakes. Enrichment can be provided by wearing hay, bracelet, or even dry leaves in the cage for the snake to explore and navigate through. The addition of novels centers and textures is always recommended for the well being. Kingsnakes temperatures require an ambient temperature of 77-84°F which is easily provided with under tank heat, heat cassette, heat cable (on the outside of the cage not inside). Temperatures can be controlled easily with a thermostat and controlled with the use of three thermometers. A thermometer placed on the hot end an inch above the substrate, one placed at the level of the testing site, and another placed an inch above the substrate on the cool end. A basket site would be 85-90° F. At night, the temperature may drop as low as 75° F.Humidity humidity should be moderate, 40-60, with higher ends used during flow. Moisture can be controlled with a igrometer and increases with the use of a large water bowl, fogger, gentleman, or daily spraying. The lightingAlthough snakes do not require UVB lighting due to all the diet it is still recommended to offer a ReptiSun 5.0. Avoid keeping your snakes by the window as this is not a UVB source and can result in the death of reptiles due to accidental heating. Products for TelefonHorizontal positioned branches should be offered for climbing as this species enjoys climbing on low level branches in the wild. Natural and artificial madness cases can be placed in the cage to increase the hidden places. Hide boxes in the shape of half logs, PVC pipes, and half skin flowers can be used. Rocks can add texture and for basking areas if placed on a source of heat and under the baking lights heated the rock. A dish of water large enough to swim in is also recommended. If you have any questions, please feel free to call us at 847-329-8709. *Snakes: Care Guide: Snake Name: No: Black Mexican Black Kingsnake (Lamproptis finds nigrita): ColubridaeAdult Long: 3-4 feet LongCaptive Bred Long AVOID: 10-20 years typically Additive Level: EasyBasic InfoMexican Black Kingsnakes are one of the many ten subscribers in kingsnake of common, origins of the semi-desert habits in northern Mexico same part of Arizona in the United States. The MBK is known for its extreme black extreme balance and have become popular within the reptile community in recent years. Feed / The wild diet, MBK's lawsuit cuts off a variety of rodents, birds, swimming, and reptiles (even other snakes) however can live in a healthy diet based for the whole of their captivity and still live a healthy life. Juveniles should nurture weekly muscles and gradually move toward muscle averages and ultimately adult muscles as they happen to adults. Unlike many captive snakes who are predatory ambus, Wasnakes are expelled the opportunity that invads the beautiful homes. What in return makes Kingsnakes typically eat aggressively in captivity and are known for being generally receptive to food. Housing/SubstrateConsidering these are the smallest closed snakes are ideal for reptile lovers who don't want a tank to take up a lot

of space. Shoppers can hold in 10 gallon tanks and gradually move up to 20-30 gallon tanks as they grow into adults. Be careful in their length while growing and trying to size your tank choice to accommodate the snake's length. For example, if your wasnake is growing to be 4 feet it would probably be wise to provide a 40-gallon tank for the snake in order to have open space free to roam (keep in mind these snakes can also live comfortably in tubs if you prefer this option). They'll ask for at least two hides, one for the hot side and one for the brother. As far as substrate goes, certain master Mexican king black prefers paper towels to simple substrate, which works perfect in twist or tank! However, many MBK owners enjoy the aesthetic of a bed type substance, which I personally feel is much more acceptable for the MBK considering they like to often dig and do tunnels. I would recommend any of these substrates to kings you incur: aspects, bech rods, and safe wood. A thick layer of any of these options will provide your snake opportunity to burrow and it is in return fun to the eye. Please avoid using sand, pine, or cedar strips for these snakes as it can cause respiratory infections. (Keep in mind that it is always an option to create a bioactive vivarium for you Mexican black wasnake as well! I'm going to provide the link below.) Be sure to provide not only hidden but also accessories to explore in the tank, the MBK is terrestrial snakes that will climb when given the opportunity. Humidity/Temperature/LightingOne redeeming quality on Mexican Kingsnakes black is since they are authentic in wilderness such as habitats; they don't need a very humid envelope. The MBK can excel from humidity levels from anywhere to 40-60. You can achieve these humidity levels simply by providing a full water bowl (which should change every day) and missing/spraying your tank only once a day. For heating purposes, I either using a heat meat together with a thermostat or you might even use a bulb as long as you provide a keeper of bulbs so your snake won't burn. As I mentioned early, as most MBK snakes need a warm side and a cold side in order to flourze health, allowing them to escape from the heat when they are too hot and move in the heat when they are too cold. The hot side would be anywhere between 85-88 fahrenheit degrees while holding a cool side of 75-80 degrees Fahrenheit. At night, the fresh side can even drop to the 70's bar. Kingsnakes do not require any form of UVB lighting, however, if you choose to assign it for your snake tank please only leave them on for 12-hour intervals only during the day.24-hour exposure to UVB lighting may insist out your MBK. Temperament/TouchOne of the reason so many black Mexican blacks have become so popular in the reptile community in the past decade is their versatility in captivity. The MBK is known to be nippy as juveniles but generally have a very behaved temperament and fits the well being handled. Although wasnakes rarely bite, when bite they are minimal and do not require medical attention... Well, as long as you disinfect the area! The MBK seems to be similar by regular touch and are great for beginners who are overcoming their pair of snakes. Wasnakes are recognised for poverty, release a horrible smell of body art when they feel in danger or insist out. These snakes are direct animals, meaning they are active during day and night, and are typically energetic snakes that enjoy excitement and execute their environment. Keep in mind that the artist wasnakes escape notoriously! Always make sure your tank is closed / lie at all times. I personally believe that Mexican black Wasnakes should be regarded as dancing snakes as well as korn snakes and ball pythons. Very easy to take care of in terms of humidity conditions and temperatures, easy to attack and all around beautiful and fun snakes to care!
