Before the creation of light bulbs, illustrating the world after sunset is a neat, difficult and dangerous task. It takes a bunch of candles or pains to fully light up a good-sized room, and oil lights, while quite effective, tend to leave soot waste on anything in their common areas. When electrical science really occurred in the mid-1800s, the creators everywhere were clams for drafting practical and affordable electric home lighting devices. Englishmen Sir Joseph Swan and American Thomas Edison both got it at the same time (in 1876 and 1879, respectively), and over a 25-year period, millions of people around the world had installed electrical lighting in their homes. Easy-to-use technology is an improvement over old ways that the world has never seen. The amazing thing about the historical turn of this event is that the light bulb itself can't be easier. The modern light bulb, which has not changed drastically since the Edison model, consists of only a handful of parts. In this article, we will see how these parts come together to produce bright light for hours at the end. Light Foundation is a form of energy that can be produced by the atoms. It consists of many packets such as small particles that have energy and momentum but no mass. These particles, called light photos, are the most basic light units. (For more information, see How LightWeight Works.) Atoms release light pictures when their electrons become excited. If you have read How The Atomic Works, then you know that electrons are negatively charged particles that move around the atomic nucleus (which has a net positive charge). Atomic electrons have different energy levels, depending on a number of factors, including their speed and distance from the nukleus. Electrons of different energy levels occupy different orbits. Generally speaking, electrons with greater energy movements in orbits further from the nuclus. When the atom gets or loses energy, changes are expressed by the movement of electrons. When something passes energy into an atom, electrons can be temporarily encouraged to higher orbits (further from the nukleus). Electrons only hold this position for a fraction of the latter; almost immediately, it is pulled back towards the nukleus, into its original orbit. As it returns to its original orbit, the electron releases extra energy in the form of photos, in some cases light photos. The wavelength of the removed light (which determines its color) depends on how much energy is removed, which depends on the specific position of the electron. Therefore, various atoms will release a wide variety of light photos. In other words, the color of light is determined by what kind of atoms are excited about. This is a fundamental mechanism at work in almost all sources of light. The main differences between source is an interesting process of atoms. In the next section we will see different parts of the light bulb. Not all light bulbs are the same. Some have smart home features, others are energy sippers. Some can be controlled by Wi-Fi, and others change colors. This week, we want to know which ones you think are the best, or are on your smart home wish list. It may seem silly to ask for the best light bulbs, but we're ready to bet that some of you have put some thoughts on where LED bulbs, CFLs, or other durable bulbs, last longest, let you control the lighting in your home, are affordable, and have the stomach and other whistles you like. If you have a favorite, let us know in the discussion below. Let's hear your vote in the discussion below! To cast your ballot, follow these guidelines:Follow this format for your vote, including bold prints. If you don't, it won't count: BEST LIGHT MENTBVote PHOTOS: [BEST LIGHT BULB] Why: Explain why this bulb is the best! Perhaps the energy is efficient, and is guaranteed to last. Perhaps it has Wi-Fi and can be controlled from your smartphone. What makes it what you recommend to others, and why? Make your case! Don't do a candidacy wip! On the other hand, if someone nominates your preferences, stars (recommend) it to give it a boost, and reply with your story. Do not leave no entries, comments directly on this post. They will just be pushed down. Save your story for someone else's submission! If you're not sure what we mean, just look at the nominations by our authors below. We'll give you a head start, and they should all be in the right format, so you can just follow our lead. Photo: istockphoto.comIncandescent light bulbs are known sometimes shattered in their fixtures—and when they do, both are difficult and dangerous to extract bulb-drained bases from the socket. Broken glass beets and the risk of electric shock should make anyone think twice before trying to take what remains of the bulb. Luckily, there are a few strategies for how to remove a broken light bulb without using your hands, and you'll probably have at least one of these three tools in hand: a pair of needle nose pliers, raw potatoes, commercially sold bulb extract. First, first things: Disconnect electricity to avoid getting shocked. For the lights, just unplug it. For wired hard lighting, flip the light switch and disconnect the electricity to the room in the breaker box or fuse. It is wise to cover the floor with a tarp to catch any roaque glass (otherwise, make sure vacuum until the area afterwards, just in case). And be sure to do safety glasses and protective gloves before starting. Although it is tempting to recyl the incandescent glass bulbs after you restore their base, this is not recommended. They are not worth recycling because it contains small wire filaments and pieces of metal too hard to separate from the glass. And unlike other types of light bulbs, such as CFLs, incandescent bulbs do not contain harmful toxins such as mercury that need to be thoroughly disposed of and recycled. So keep tossing them in the trash (just be sure to pack them well so the glass won't digest the bag, which can injure anyone who handles the litter). &Tools;MaterialPhoto: istockphoto.comBulb #1 removal technique: Needle nose PliersThis method is simple, but continue slowly and carefully that you do not damage the light fixtures. Take a pair of needle nose pliers from your toolbox and carefully grab the metal rim of the bulb base; Bend a little into if you need to get a better grip. With pliers you firmly stuck to a broken light bulb, try to slowly unscrew it. If it doesn't budge right away, repeat the basic metal bending process into a few more places until it starts to collide or the base breaks apart at all. Then remove the remains and throw them away and bulb in the litter. Photo: istockphoto.comBulb Removal Techniques #2: Raw Potatoes That grade school experiments when your teacher powers light bulbs using potatoes? It turns out that potatoes can do more for light bulbs than just providing electricity. They can be used to extract the tip of a broken light bulb safely from the socket. There are two ways to try this method. First, slice the medium-sized raw potatoes by way in half, short. Dry excess moisture with paper towels, then push the tip of the potato cut out loudly to the base, deeply-deep as it will go-support a glass filament at the base of the bulb and any burst glass pieces that stand out from the base should cut through the potatoes and bond both together. Turn the potatoes clockwise until the light base begins to decompose. Remove the base of the broken lamp bulb, remove the potatoes and bulbs, then dry any part of the possible wet fixture. If the trial fails, you may need a stricter fit. So carve the final round of the other half potatoes into the cylinder to fit the snugly in the socket (not too many screw threads, as the previous method allows). Firmly press into the base of the lamp until it safely, and turn the potatoes towards the clock until it turns the base along with it. Photo: istockphoto.comYou may already have a commercial bulb extraction on hand or decide now's time to buy one. Available for around \$10 in good home improvement centers and online retailers Well-reviewed tools from Bayco on Amazon), this tool is usually made to extract both standard or smaller sized bulbs. They have rubber tips that you just wiggle into the base of the bulb, just like any other method, and rotate the clockwise. If you have your preferences in store or online, consider choosing one with a base that allows it to be screwed into longer pillars—that way you have the flexibility to reuse it if you need to remove hard-to-reach overhead lights in the future.
