Standing rock nd weather forecast

Photo: ShutterstockAnalog WeekAnalog WeekJust because 'there's an app for that' doesn't mean you have to use it. This week we're going analoguely, reminding that we can live - and live well - without smartphones and see what's worth saving from the times before we've all been involved in 24/7. Strange time we have, right? I don't know where you live, but I assume it's on the same planet as me, and here in the northeastern U.S., a typical day involves an outpouring of rain in the morning, hot and humid around mid-day, then a cold and possible greeting until the evening commute. The unpredictability of the weather forces me to consult at least two weather apps before deciding whether it is safe to ride my bike to work. But, more often than not, one app will tell me that it will be clear all day, and another will predict a 30% chance of rain. What to do? Screenshot: Melissa Kirsch (Dark Sky; Time channel; WUnderground)The two apps I use are Dark Sky and Weather Underground for iOS. I can't tell you what's more accurate; I can only tell you they rarely get along. The best rule for determining whether you should bike work, if you should try to squeeze that ride in, if you should bring an umbrella when the app forecasts conflict is to practice negativity bias. That is, trust the forecast with worse news. If Dark Sky says Overcast, and Wunderground says a 30% chance of showers, trust Wunderground and grab your slicker. This is how you're prepared for the worst. You probably have a negativity bias in other areas of your life where it doesn't help you - you take criticism more seriously than compliments. In most other aspects of your life, negativity bias does you no favors. When it comes to time, lean into it. Another factor, of course, is your feeling - or, as Lifehacker staff writer Nick Douglas says, look at your face. You'd think such tips were too big to even state, but the whole reason we check our apps is because we don't trust ourselves to tell the time. If both apps say the coast is clear, but dark clouds are definitely looming, you should assume that, living here at the moment and a place in time in the world, you know what you're observing and noticing it's going to rain. Forecasters analyze atmospheric simulations from some of the most powerful computers on the planet. They collect observed data from stations, satellites and buoys around the world. They then compiled all this information to prepare reports on likely weather conditions for a specific geographical area in the immediate to short term. Educational requirements for forecasters vary considerably due to the different needs for forecasters in different industries and markets. Many meteorological open places, especially those with local news, have low educational requirements for potential employees. In most cases you just need to have a bachelor's degree in atmospheric sciences or meteorology, or in a closely related field such as physics. Some employers will accept almost any four-year degree. This level of education gives you a skillful reading of time data, but it does not provide you with a fluid understanding of the workings of the atmosphere. Some additional educational requirements may also apply, depending on the nature of the job. For presenters on television or radio, employers like to see previous experience in the broadcasting industry or other on-camera experience. Meteorologists who procure written reports must demonstrate good writing skills. The low minimum requirements for a forecaster stem from the fact that popular weather forecasts like those on TV rarely consist of any scientific nuance. They only seek to inform the public about the basic weather conditions in the near future, rather than explaining how it all works. Most weather presenters don't even compose their own forecasts, and many would be under severe pressure to accurately explain the weather phenomena they report. Instead, they just gather information about the forecast from sources such as the National Weather Service and then add some local footage of a flooded road or children playing in sprinklers. To understand the work of the atmosphere and compose intelligent forecasts yourself, you need a higher level of education. For example, potential meteorologists of the National Weather Service must demonstrate advanced expertise in physics, calculation, computer science and, of course, atmospheric science. Graduate degrees go a long way toward building on the basics of bachelor's degrees. Some of the better television meteorologists also own this level of education, and executives in many major news markets like those in Los Angeles and New York require it. Atmospheric scientists, including meteorologists, earned a median annual salary of \$92,460 in 2016, according to the U.S. Bureau of Labor Statistics. At the low end, atmospheric scientists, including meteorologists earned a 25th percentile salary of \$69,860, meaning 75 percent earned more than that amount. The 75th percentile salary is \$114,510, which means 25 percent earn more. In 2016, 10,400 people were employed as atmospheric scientists, including meteorologists. The 2019 Thanksgiving weather forecast predicts snow, rain and potential blizzards. The Midwest will experience the worst winter weather in the days before Thanksgiving. Passengers should expect significant delays, both on the ground and in the air. We hate the rain

on your Thanksgiving Day parade, but next week’s weather forecast doesn’t sound good. According to AccuWeather, at least three major storms are expected, different parts of the US ahead of the upcoming holiday. Parts of the Midwest and Northeast could see a wintry mix of snow and rain as early as this weekend and will only get worse from there. This content is imported from {embed-name}. You may be able to find the same content in a different format, or you may be able to find more information on their site. Starting Tuesday, a significant and potentially highly disruptive storm could bring heavy snow to a 1,200-mile stretch of inland. This winter weather is forecast to spread from Colorado all the way to parts of Wisconsin, Minnesota, Illinois, Indiana and Michigan by midweek. It’s also possible that blizzard conditions, including high winds and poor visibility, may develop in the Upper Midwest on Wednesday - the peak time to travel on Thanksgiving. This content is imported from Twitter. You may be able to find the same content in a different format, or you may be able to find more information on their site. As you may have guessed, this forecast and weather is not a good combination for people trying to get home for the holidays. Severe weather is likely to cause significant delays for passengers both on the ground and in the sky. According to the American Automobile Association (AAA), more than 55 million people across the U.S. plan to travel at least 50 miles before Thanksgiving and, even with ideal weather conditions, there’s nothing worse than Wednesday. In other words, you might want to tell grandma you’re going to be late for dinner this year. This content is created and maintained by a third party and is imported to this page to help users order their e-mail addresses. You may be able to find more information about this and similar content on piano.io As I recall, the weather looked more or less the same on TV. Of course, the weatherman can change and weather conditions vary, but a format consisting of one person standing in front of a screen that displays a flat, abstract view of the forecast? It’s as unchanging a part of the television landscape as the anxiety-inducing news and repetitions of Friends. But try saying if it’s not broken, don’t fix it for the people at The Weather Channel. This week, the channel unveiled a new twist virtual views on television weather. It uses mixed reality technology to transport network meteorologists on camera to various cities to show the time before it happens. Imr’s innovative virtual display segments integrate into The Weather Channel’s daily programming and live forecasts, featuring landscapes and backgrounds from about 50 cities across the U.S. Weather shows are unique in doing so as we provide information about future events. no video footage of that event, Mike Chesterfield, Sr. weather presentations on the Time Channel, Digital Trends said. While traditional news has the ability to show a video of what happened as a clear way to tell a particular story, we often don’t have that advantage because the events we provide information about have yet to happen. By creating hyperrealistic simulations based on science and hard data and providing expertise for meteorologists immersed in these environments, we now have a forward-looking video product that allows us to convey the messages we are trying to cross more clearly. Chesterfield described the feature as a real post that allows time managers to show, rather than simply telling the audience what time will look like over the next few days. Warren Drones, senior technical aartist at The Weather Channel, explained that the setup still includes a classic green-screen time lineup that is meably portrayed in the film Groundhog Day. However, the graphics are provided by a real-time Unreal Engine-based render system that provides realistic 3D graphics - and some carefully implemented camera moves. While the graphics are displayed on this engine, the position of the camera is sent as data to reality engine, synchronizing the view of virtual elements on their positioning in the green screen space, Drones told Digital Trends. The maintenance and driving of these complex systems during live shows can only be done when everyone involved understands how the tools work and what they can do. Editor’s recommendations
