CrossFire: Legends is the popular first-person shooter game brought to mobile. The game maintains the overall aesthetics of the PC version and adds new features and functionality to facilitate the smooth mobile gaming experience. Game modesThere are three game modes: Team Death-Match (TDM), Demolition and Bot Modes. In TDM, two teams will battle it out to score maximum kills, which gives the game its novelty. The three maps are different thematically, but manage to maintain the same feel. The demolition operation consists of two groups. A group tries planting the bomb in a bombsite; The other team is tasked with neutralizing the bomb. Battle Royale includes everything you'd normally expect from an FPS game, including solos, groups, and duets. Solid Graphics Graphics are one of the first features you notice in the game. Unlike most mobile games that polish and perfect graphics as simple as possible, this game has not cut any such angles. The graphics will remind you of games from the past. The nostalgia associated with it gives the game some charm. The game is constantly updated - with various functions, such as mutation and hero, added to the process. The evolution of the game is based on your perseverance. Regardless of the function, you will gain experience that will allow you to climb classes. This time (along with the standard PvP mode) you will find that there is a new variation in gameplay, including a full 'Battle Royale' arena where you will encounter over 120 players armed to the teeth. Play solo mode, in 2p games or in groups of up to 4 players. Along with the seemingly endless number of game modes that Crossfire: Legends will find that there are many classics, including Deathmatch, Sleeper Mode and more. Choose from over 20 different details, including the sections where players in mutants, or choose mission mode, where you can go out on a quest while gunning down the hordes of enemies that appear on the screen as you go. The main appeal in this game is that it works on any device, no matter how meager it could be. In addition, as it works on Android 4.0 or later and requires just over 1GB of RAM, you'll enjoy without overtaxing your smartphone's resources. Your. in 'Battle Royale' mode you will enjoy over 60fps that will remain stable throughout. The other awesome feature is that CrossFire: Legends runs perfectly well without an internet connection. In fact, in offline mode you will play against AI bots that are fully customizable, choosing from different difficulty levels. In 'Battle Royale' mode, players start with a plane. A second later you'll jump off the aircraft and parachute your way down to a certain spot on your map. The name of the game is to survive and become the last man standing, so you've probably already guessed that being the first to grab as many gun and ammunition boxes is key to your survival tactics. In addition, again there is a deadly blue force field that extends out and decreases as you play, adding to another potential threat. Other game modes are based on the standard FPS game, but you can still choose to change your settings to your preferences. CrossFire: Legends is a fun game where you play in solitary mode as well as against other online players. Best of all is that despite the 'Battle Royale' feature being its main appeal, there is also a fine PvP function just like the original CrossFire: Legends game. The most successful games in China (2018) In the world of video games, sometimes we tend to be a little short-sighted when it comes to evaluating the top games in the industry globally. After all, a game that is a smash hit in Asia may end up being unknown in the west, just as we mentioned some time ago with Crossfire. On Android, the geographic difference is even more drastic, since there are markets that are exclusive to Asia, such as Quooapp and TapTap. That said, we're going to try to take a look away from distant lands by presenting the nine most played Andriod titles in China, courtesy of reliable market studies completed by NewZoo. See more Crossfire: Legends, everything you need to know about the biggest FPS in Asia Users outside Asia may not be very familiar with the Crossfire videogame, but this doesn't come close to reflecting the full success of this PC game which, until recently, was the most profitable free-to-play game in the world. In fact, this game was so successful that Tencent released the international adaptation for smartphones earlier this year. FPS CrossFire: Legends brings us the classic PvP mode of the original game and adds new game modes, such as the inevitable Battle Royale and a single-player horde mode. And if that wasn't enough, the game can be played offline and is still able to play on less powerful devices. See more five new alternatives to Battleground Playerunknown for Android There is no doubt that PUBG Mobile has one of the most important games of the year. Its significance is real, and the only thing that can slightly overshadow it is the future release of Fortnite. Fortnite, the importance of this Battle Royale game has led to heaps of clones for Android. We already did a recap of these a few months ago, but today we're back to talk about five new clones of PUBG that have arrived on mobile devices. See more CrossFire is an online multiplayer first person shooter developed by South Korean company SmileGate. The game consists of a variety of ways you will participate in playing either a blacklist or global risk, terrorist or counterterrorism. There are several scalability features to track your progress. Extremely successful shooting game In the heyday of Crossfire, in 2014, made a big splash in the East. It was and still is a modern game in the East, especially in China, where they have many servers. However, it never did too well in the West, even after some success. Soon SmileGate will release a console version that seems to be looking very good. However, they have not done a good job consistently supporting current versions. Like Counter-Strike, it has suffered from weak protection against cheating. Crossfire is technically free-to-play, but has many of the features of a pay-to-win model. The game is particularly known for its variety, which makes it stand out among its classic fps peers. What's Crossfire? Crossfire relies heavily on the team against the team of older FPS vs PUBG style teams or anyone against all. What makes it quite unique about its location is that cf has a lot of variety of game modes on maps in customization. There are 8 types of weapons to choose from, such as sniper rifles and SMGs. Weapons allow you to send your enemies. There are over twenty game modes with developers constantly adding more. Team Deathmatch is the classic team vs team. The other stand out is the sheep mode where you try to gather as many sheep or king as possible, where you have to play minigames to achieve success. To upgrade and customize your character, you can either use ZP based on real money or GP earned in the game. Now, the game is more bent towards paying to play, so ZP gets you faster. There is a lot of customization available, however, which keeps it fresh. Graphics and gameplay The game graphics are significantly poorer than other FPS games like Apex Legends. They still use a resolution of 1024×768 and even when the game came out it was known for the bad screen. There are no settings to help solve this problem. It is the where the game can be seen. This factor can be seen as a plus because newer games are difficult to run on older systems. The gameplay lags sometimes, but overall it's ok. It is ideal for older computers because it runs just fine, on XP, Vista, Windows 7, and then on new versions. Sometimes, the system will flag random files as hacking devices that show the inherent weakness of the software. Unfortunately, they have very few servers because the game is played less. In some countries the systems have been shut down, which means multiplayer can come with some delay from country to country. Bugs, hackers, and more There aren't too many bugs in the system, but especially on newer computers it will definitely run on some as Customer has changed wrong. Overall, the user experience is not overly mitigated by existing problems. The main problem is hackers. If you don't play privately, there's very little protection against hackers in the game. Also pay to play players have great advantages with weapons that will destroy you in a second. Alternative games For an older style game, CS:GO is an obvious choice. Although it doesn't have as many functions as CF has, Counter Strike has more players, especially in the West, more maps, better graphics and gameplay. Unfortunately, you will encounter poor anti-cheating regulations. If you're willing to stay in the free FPS realm, Apex Legends is another option. Everything is better about it than gameplay to no hackers, to amazing graphics, to elegant racing. The main problem is that it needs a much better computer to run. A bit of fun, a few problems When looking at what FPS to play, it all depends on what you want. This has some mechanical fun in it, especially in all the ways available. For those with a weaker computer, this can be cool. If not, this game is one that could be omitted in favor of younger first-person shooters. Recent updates aim to cut back bugs with newer versions of Windows and deter hackers. Of late, attention hasn't been on this game as the company focuses on a new market, so don't expect huge improvements. Improvements.
