Noise and non-linear distortion chapters and active devices have been added together with noise range and more materials for intermodulation distortion and associated non-linear effects. On active devices there is more up-to-date material for bipolar intersections and field transistors. New and updated material for wireless communication systems, including connection budget, connection margin, digital modulation methods and bit error rates are also part of the new release. Other new material includes a section on transition lines, energy wave theory, a discussion about higher order modes and frequency effects for microsmples, and a discussion on how to determine unloaded ones.
