Moses Velutina takes care of perfect sunlight, partial shade water keeping soil moist soil rich, wet temperature 25 dG C fertilizer weekly during growing season, monthly during the winter Moses Velutina uses decorative: used as a decorative perennial plant that is commonly grown for decorative medicinal purposes: plant roots are also sometimes used for ayurvedic culinary preparation : Male buds may be cooked or used in salads, while leaves are often incorporated in making banana plant reproduction dressings in different ways mainly by lamps or rhizomes, sucker swords and tissue cultures. Yes, one can start growing a variety of banana plant dwarfs in pots having at least 7-10 inches of upper diameter and drainage holes. Re-pot the plant when it grows in the current pot. Note - For more details check the product description nurserylive.com the main reasons for the dying banana plant are as follows 1. Due to more than water or less water to the plant. 2. The plant does not receive proper sunlight. 3. Nutrient deficiency. 4. Disease and infestation of the disease. Note - For more details check the product description on nurserylive.com yes, the banana plant loves the perfect sun. Direct bright sunlight for more than 6 hours a day is ideal for the development of flowers and fruit. The banana plant grows from a lamp or rhizome, emerging from these rhizomes of a trunk that is actually leaves wrapped around each other. New leaves grow from the center of the trunk. The flower stem also comes out of the center of the trunk on which the fruits develop in about 9 months. When the fruiting is finished, the trunk dies, new plants called suckers go out of the rhizome, which can be separated from the rhizome to grow into new plants. We name bananas as trees, but scientifically bananas are plant plants because it has no wooden texture on the stem. Bananas belong to the Mussian family. Bananas are a tropical plant that belongs to the Family of Moses. Known for its delicious fruits. Bananas are plant plant plants because it has no wooden texture on the stem. Banana plant trunks are actually leaves wrapped around each other. Bananas can be planted on garden lands during January & February and November & December. The population of banana plant varies according to diversity, and the planting of dwarf species is planted remotely at a distance of 1.5 per 1.5 square meters, with 1,777 plants per hectare. According to Hasto Shastra, the banana plant should be in the north-east direction. No, the banana plant cannot grow in full shade. More than 6 hours a day requires direct sunlight, and for the rest of the time the shadow will do no harm to plant growth. To plant banana plants consider the following points 1. To grow the banana plant in the pot, choose a pot with 7-10 inches of upper diameter and drainage 2. Fill the pot 1/3 with well-drained soil rich in organic content and put the plant in the center of the pot. 3. Fill the remaining pot with the same soil. 4- Keep the plant indirectly in the place of bright light for 2 to 3 days and then gradually move to a place that receives direct sunlight for more than 6 hours. 5. When the plant is over grown in the current pot, it is planted on the farm. If you are planting the purchased plant directly on the ground follow the procedure below. 1- Keep the plant indirectly in bright light for 3 to 4 days and gradually move to a place that receives direct sunlight for more than 6 hours a day. 2. Digging the pit is twice the size of the current plant bag/pot in. 3. Fill the pit 3/1 with soil rich in organic content, place the plant in the center and fill the pit with the same soil. 4. We use water. General care tips - The plant should get more than 6 hours of sunlight a day. Plant water when surface soil (1-2 inches) feels dry to touch. Apply any organic fertilizer during the main growing season (June-July). Banana plants can be grown in pots and gardens, consider the following points for the growth of banana plant 1. Sunlight – At least 6 hours of direct light is required in the morning. 2.Soil- Soil or pot mixture should be well drained, fertile and nutrient-rich. 3.Water - Plant water when 1-2 inch soil layer surface feels dry to touch. Raw fruits, flowers and leaves are used for culinary use and ripe fruits are consumed deserty. Note - Please consult your health consultant before using or consuming banana plants or plant parts in different ways, mainly with lamps or rhizomes, sword suckers and tissue culture. Yes banana stems produce only one bunch of fruit and die by proliferating pus. Apply any organic fertilizer during June -July for better development. Yes, banana plants have flowers and start blooming in April, May, June. Yes, bananas are water-loving plants. The main reasons for the yellowing of the leaves are 1. Less or more water to plant bananas. 2. No proper sunlight 3.Heavy influx of disease and disease yes, we can plant banana tree at home with proper care and management as follows 1. Sunlight – At least 6 hours of direct bright sunlight is required. 2.Soil- Soil or pot mixture should be well drained, fertile and nutrient-rich. 3.Water - Plant water when 1-2 inch soil layer surface feels dry to touch. The banana plant needs direct sunlight of more than 6 hours a day. You can plant a banana plant preferably outdoors, in pots or on land at one point get below the growing conditions for the plant - 1. Direct bright sunlight for more than 6 hours a day preferably in the morning. 2. The soil should be nutrient-rich and well drained. 3. Apply water when the soil (1-2 inches) feels dry to the touch. Repot banana plant when it is too grown in the current pot and preferably during April-May, yes, to grow banana plant indoors Score under 1. Sunlight – At least 6 hours of direct bright sunlight is required. 2.Soil- Soil or pot mixture should be well drained, fertile and nutrient-rich. 3.Water - Plant water when 1-2 inch soil layer surface feels dry to touch. Yes, banana plants can survive in winter but not at cooling temperatures. The optimum temperature required is 25 to 35 degrees Celsius. The image is not available for Culver: Red Dwarf Banana offers vexed juice fruit for its excellent fruit, the red banana tree dwarfs bakers' and cooks pleasure, with very sweet fruit that is soft, with custard-like consistency. Feel free to keep it open; It enjoys full sun and durable leaves and trunks make it resistant to high wind. If you can offer red banana dwarfs your desired climate, consider yourself lucky! Order now, while they are still in stock. Planting & CareSeasonal Information – Bananas prefer bright light conditions for 12 hours per day if possible. Constant heat is also very important, with high humidity (above 50%). Night time temperatures of 67oF and day-through temps in the 80s; With good air circulation is ideal. Retain moisture in dry environments by misleading and placing it on a layer of pebbles or decorative stones in a tray filled with water. Red dwarf bananas can be grown in hardy areas 8 and up. Otherwise, indoor growth is primarily with visits to the outdoors when high temperature regimes can be met. Location and exposure – Sun exposure determines fruit growth and/or foliage color. Provide a perfect sun position for your banana plants to make them their best fruit production. Grow in a partially shaded area if aimed at decorative foliage that remains a deep, rich green color. Of the recommended wind. Soil preferences – Provide sandy soil that is rich in organic matter so that drainage is good, but keeping water and supplying consistent nutrients can be achieved. If your compound is created from the soil, use sand, perlite, and compost or maneuver. Soil pH should be slightly acidic, in the range of 5.5 to 7.0. Finely adjust the pH with sulfur before planting. Planting instructions – in pots: Bananas have rhizomatosis roots that grow from the corm. They can also be fast manufacturers, so size their pots accordingly. At least 3x will eliminate the root ball size in planting requiring constant re-pot. Tighten the soil around the root ball and do not bury the crown of the plant. Plant in the soil mixture as prescribed above, and water well for the first few weeks. Don't overwater the water to the point where the soil is flooded. They'll get a lot of water and they're heavy feeders. Fertilize in planting, preferably with organic fertilizer. In the garden: The recommended distance in a garden is about 4' so as to create a stand, or patch bananas. The plant is in sandy, slightly acidic soil as high, with plenty of organic matter. Prune the mulch heavily before winter and prune the leaves backwards. Water – Provide consistent water and maintain high moisture content, but avoid saturation or water entering the soil. Daily water, sometimes twice a day in hot and dry climates. Let them completely dry out in between water. Fertilization – Organic fertilizers are based best as they are released over time and not water because of constant water. Young plants want more nitrogen to help them grow fast. Once established, the use of fertilizer with high nitrogen and potassium, 15:5:30 is a good formula, and is a monthly fertilization in spring and summer. Water deeply after the use of fertilizer. Diseases and diseases - Bananas are exposed to significant disease outside the tropics. Root rot will occur in cold and humid soil, and is by far the biggest threat of disease to them. Excessive watering symptoms are leaves that die and brown on the edges. If the leaves turn yellow, they need more nutrients. Some of the insects that may attack your banana plant include banana aphid, banana weevil, and coconut scale; And all are easily excreted with mild organic insecticide or Neem oil. Oil.
