Zeepin Tyre Pressure Monitoring System (TPMS) can monitor tyre pressure/temperature status in real time, which will transmit real-time voice alarm and flash 1 Feb 2020 ZEEPIN Solar Power Wireless Tire Tyre Pressure Monitoring System some users complained about the unclear installation instructions of TPMS. Read all instructions and warnings before installation. Improper installation will cause the TPMS system of the motor vehicle to fail. Sensors always ZEEPIN TPMS Solar Power Universal, Wireless Tyre Pressure Monitoring System with 4 The included user manual will help you get it set up and goes to just one main feature: - Powerful TPMS: ZEEPIN tyre pressure monitoring system 1 x Sticker, 1 x English User Manual IPXX IP Rating Diagram IP Code IP Code (or Got This Zeepin C220 Solar Powered TPMS with External Sensors from Aliexpress Recently. Has Options for External or Internal Sensors. Aliexpress Product Page: C220 Solar Energy TPMS Technical Specifications & features: • Intelligent alarm: Leak warning, High temperature warning, High pressure warning, Low pressure alert • Screen operating temperature: -40 Deg.C – 85 Deg.C • Temperature range monitoring: -40 Deg.C – 85 Deg.C • Pressure range monitoring : 0 – 5 Bar • Display battery capacity: 1000mA For external sensors: • Sensor operating temperature: -40 Deg.C – 80 Deg.C • Sensor battery supply: CR1632 battery • Sensor battery capacity: 1 120MA For internal sensors: • Sensor operating temperature: -40 Deg.C – 125 Deg.C • Sensor battery supply: CR2050 battery • Sensor battery capacity: 345mA The box Open Contents box • screen • External sensor x4 • Key • Nut lock x4 • Button head cap • Mounting tape • English manual • Warranty card Display unit External sensors Nut lock & key Head cover Button Tape placement English manual & warranty card How to change the battery of external sensors External sensor using a CR1632 battery. Setting It is recommended that the display unit be first charged via the micro USB port before the position in the car to be Final thoughts A nice little cheap tool to help monitor the pressure on your tires. Less worry about having a flat tire unknowingly. Notice while driving the pressure will fluctuate some PSI. Guess this is normal due to external conditions such as tyre temperature, etc. AliExpress Motorists Measurement Tool This pressure sensor I bought back in late 2017. He called right after the new year. I've been thinking about the review. But at first it was not possible to install them on wheels, and then somehow everything forgot. I didn't even think about it. But when I mentioned that I use such sensors, in one of the sales, I wrote in person 10 people with a request to do at least a brief review. That's why I'm doing this review. Thus, the pressure and temperature sensor on the wheels, the zeepin C220. It was bought at one of the sales. Honestly, I thought for a long time if I needed him. But he made up his mind. Sensors come in two kinds. Indoor and outdoor. Outdoor and cheaper, and easier to install. But there is one drawback: they can be unscrewed by anyone. And they really attract attention. The domestic doesn't have such a minus. But they have another drawback: to install them, you need to completely overdo the wheels. And another not obvious drawback: in tire labs I just didn't want to put these sensors on wheels. It looked like some alien technology, and with the words don't bro, ny! I'm not going to do it! I'm going to break one more thing! But it's all right. The sensor comes in a beautiful box. The gift is so simply a great choice. This is a purchase from the category very few people will buy, and as a gift will get, would be happy As we see, the box goes under different variants of sensors and modules (powered by a lighter/ powered by a solar panel) Kit: Four internal sensors, 4 screws, 4 nipples (by the way their correct name: wheel valve), main module and sticker to install the module on the panel: Read more: Nipple. More specifically wheeled valve: In disassembly: Made of metal. Installed on the wheel from the inside and smuggled from the outside with a nut. Also, from the inside to the inside with the help of a screw is installed sensor: Each sensor is signed. And responsible for its wheel: RR and RL - back right and back left. Both FR and FL are front right and front left. The sensor itself can be disassembled. Powered by a CR2050B lithium battery. For analysis it is more convenient to use a currency: Completely in the collection of the sensor looks like this: It is in this format is installed inside the wheel. And to see what the sensors show, a screen module is installed in the cabin: The unit is powered by an internal battery charged by the solar panel built into the top of the unit: There are three buttons at the top to turn on and adjust. Down: There are vents on the sides. And on the left side there is a MicroUSB port to recharge if the sun's power is not enough: The front of the unit is intended for sensor information: The upper left corner indicates that it is selected to display the temperature in degrees Celsius. Left under pressure on rods. The yellow digits in front of each wheel indicate the temperature inside the wheel. The white numbers show pressure. Bottom right has a charging level The upper-right corner also displays a sun icon showing that the unit is currently being charged by the solar panel. Then I'll tell you about the installation. As mentioned above, finding a master who agrees to install sensors on wheels turned out to be another problem. First I showed them the whole sensor box. He immediately spat, refused. Then he showed only one sensor with a nipple and said it is necessary to change all nipples on wheels. Then they agreed. In fact, there is nothing complicated in the installation. Installed in Mazda Cronos: After installation on each wheel according to the tyre repairer inflated 2 ATM In the module appears 1.6 BAR: The temperature inside the wheels 0 degrees. So far I drive as my pump also shows that there are 2 atmospheres on the wheels. Sensors slightly underestimate the pressure. I don't know why. According to the store, the module can show a temperature from -40 degrees to 125 In this photo taken at night you can see that below the temperature on the sensor there are 3 parts of the numbers, and for the pressure of the 2nd section: I also noticed that at different times of the day, depending on the ambient temperature, the pressure indicators can change. Conclusion: The device as a whole works. Underestimating the pressure readings judging by the huge number of revisions is only shown in my copy. (still wrote to the seller but has not received a reply yet) On the order page a bunch of positive reviews with photos. The unit is charged only by sunlight. The charged battery is enough for a long time. There was never a need to recharge the drive via the USB connector. Battery shows how complete. In the morning, when I come to the car, even after night parking, the battery looks full. The unit has a speaker. Now, if it turns out that I have a flat tire, when it moves and not only, the unit will start screaming loudly. Also, when the temperature is exceeded. (temperature limits and pressure limits are set in settings. I wish everyone only happy purchases. I'm planning to buy a z21 Add to review Favorites liked by z40 q61 q61
