Access 2010 search key not found in any record

Is there often a problem with a search key in an Access database that was not found in any record? Tried all possible solutions best to your knowledge, but nothing worked to solve it? If you are also one who faces a similar kind of problem then you will definitely find this blog useful. Contains all possible solutions to resolve this Search Key Was Found In Any Record error that occurred in any version of the MS Access database. So just try the proposed solution ..... and fix this problem with access on your own. Like you, there are many users who portray the same problem in their respective Access database. Check it out...! Fixes problems with microsoft accessrun database scan with Stellar Access Database Repair Tool to repair inconsistent Access database. When the scan is complete, the repair process restores the database to its normal state, correcting all errors. By clicking the button above and installing Stellar Repair for access (14.8 MB, $79 USD), I recognize that I have read and agree to the End User License Agreements and privacy policy on this site. Practical scenario: I created a payroll database in Access 2010 and everything works fine. Then I copied the entire database to another computer (also running Access 2010) where it will be used. When several reports open, the report opens normally, but after a certain time you receive the following error message: The search key was not found in any record. The entire database has been copied to the new computer - no spreadsheet imports are involved. I totally do not understand where the problem actually occurred ....! If anyone can suggest any fixes to solve this then I will be very grateful. Thanks for any help. Scenarios for the occurrence of the search key not found in any error record Here are a few cases in which users mostly encounter the search key not found in any record problem. when you type a large amount of text in a memo field that contains an index in Access: Run-time error 3709 The search key was not found in any record error message also found when compact accessing database or saving design changes in Access Search Key was not found in any record importing an Excel spreadsheet into an Access database table The same error was detected even then when someone tries to save a record where the memo contains more than 2048 characters. You can also like: Top 4 Best Fixes to Solve Access 3021-No Current Record Error...! Fields you need: See if there are .inf files in your contact set folder. Because the presence of these files indicates that someone used Access to work with these files and created indexes that no longer exist. .inf files can be deleted safely to resolve this issue. Can see if this is the case with your Access program Corruption. Because Microsoft Access has a built-in tool for detecting and repairing corrupted dBase files. How to fix MS Access search key not found in any record that occurs under different circumstances? Here mainly we will discuss the most common situations where this search key has not been found in any record occurs. So, let's discuss one by one in a nutshell. 1. When a search key was not found in any Access 2010/2013/2016 database record. 2. Access Run-time error 3709: When you type a large amount of text into a Memo field that contains an index in access. 3. The MS Access search key was not found in any record error message when compacting the database or saving design changes. Case 1 # How to fix a search key was not found in any record in access 2010/2013/2016 This workaround applies only if you do not know the exact reason for obtaining this access The search key was not found in any record error. In this scenario, the resolve key search was not found in any record in Access 2010/2013/2016, to obtain the latest Jet 4.0 service pack. For more information about how to download the latest Jet 4.0 service pack, click the following article in the Microsoft Knowledge Base: How to get the latest service pack for microsoft jet 4.0 database engine case 2 # How to fix access Run-time error 3709: When you type a large amount of text in a Memo field that contains an index in an Access database Symptoms when you create a Memo field that contains an index, or create a field name that contains automatically indexed text, then you cannot enter text in the field that contains more than approximately 3450 characters. In this situation, when you try to run existing data, you receive the following error message. Run-time error 3709: The search key was not found in any record. Workaround To resolve this issue, you must enter a large amount of text in the comment field. To do this, follow these steps: First, you need to open the table in Design view by using the Memo field. On the View menu, click Indexes. Note: In MS Access 2007, click the Design tab, and then click Indexes in the Show/Hide group. Tap the anfield index of the note, and then delete it. Case 3 # How to fix access search key not found in any record error message when compact database or save design changes? Symptoms This error often occurs when you try to save design changes to a new object or when you try to compact a database. The search key was not found in any record. You may find that the database object is listed in the database window, even if the saving process is swept away. As you try to open an object in an Access database, you receive the following errors: The Microsoft Jet database engine cannot find the object name>. Make sure that the object exists and that you spell its name and path name correctly. Cause The search key was not found in any record the problem occurred under the following circumstances: A database created when you use a workgroup file (System.mdw) that is created with Microsoft Jet 4.0 Service Pack 4 (SP4) or the former. The workgroup file currently in use is created using Microsoft Jet 4.0 SP5. After you install Microsoft Windows 2000 SP2 or use Jet 4.0 SP5 on your system, you must use the User-Level Security Wizard to save the database. Select an option in the wizard to create a new workgroup file. How do I search for records in access when a search key is missing? Method 1# Filter to display specific records You can apply a filter to display only a specific number of records that meet specific criteria and comparison operators. To narrow the search for records, just right-click the field that you want the data to match. Then, from the shortcut menu, select contains, equals, does not contain, or does not equal. You can turn this filter option on/off so that you can easily switch between filtered and unfiltered views of the same data. Unlike the search option, the filter displays only a limited number of records. To apply filter options based on selection, you must first open the table or form. Make sure the table or form has already been filtered or not. Go to the Home tab, and then in the Sort & Filter group, tap Advanced If your desk or form is already filtering before, you'll be given clear all filters. Then tap it. Find the record that contains the value that needs to be used to search the filter. Then tap in the control (in Form, Report, or Layout view) or in a column (in Data view). Depending on the partial filter selection, just select the characters you need. Then go to the Home tab, and then tap the Sort & Filter group and select Selection, and then select the filter that you need to apply. To filter out other fields of your choice, just repeat steps 3 and 4. Method 2# Record search using the Docmd.Findrecord method in the FindRecord access method performs findrecord actions in Visual Basic access. Syntax: Expression. FindRecord (FindWhat, Match, MatchCase, Search, SearchAsFormatted, OnlyCurrentField, FindFirst) expression A variable that represents a DoCmd object. Remarks When the procedure requires the FindRecord method, Access searches specific data into records. The search order is arranged by editing in the lookup argument. When MS Access retrieves this specific data, a value for the record is selected. This FindRecord method does not return any value to indicate its failure or task success. whether the value is present in the recording room or do not use findnext, findprevious, or findfirst, findlast method of the Recordset object. With this method, you can assign the NoMatch Property value to True if you are unable to find the specified value. Example Here's the following example to meet for the first time in records named Smith. VBCopy DoCmd.FindRecord Smith,, True,, True Wrap up: Try the above fixes to resolve the search key not found in any record problem. And do share your experience after trying these fixes in our comment section. Still in trouble? Fix them with Stellar Repair for Access: This software ensures seamless repair & recovery of ACCDB & MDB database and restores all objects including tables, reports, queries, records, forms and indexes along with modules, macros, etc. Troubleshooting Microsoft Access now in 3 easy steps: Disclaimer The entire content of this site reflects my opinion, not my employer's. I also use Amazon affiliate links to direct you to books/resources that you would find useful. Well, I got this error message today when I tried to import a text file: The search key was not found in any record After some research, I found that either it was an error caused by a Microsoft Jet 4.0 Service Pack, or it was the size of a database (should not be larger than 2 GB). It turned out to be later. I solved this problem by compacting and resizing the database. In Access 2007, click the Office button (upper-left corner), and then > compact and repaired database.
