Bamboo flooring cost lowes

Bamboo flooring has evolved into one of the largest segments of the wood flooring industry over the past 10 years. That's because it's much cheaper and more durable than most wooden flooring options out there. But will it work as a building material for you? Here's a bamboo floor primer. First, bamboo is not wooden at all. It is a type of grass, the largest grass in the world, and there are dozens of varieties. The one most used for flooring, called Moso bamboo, is from China and other parts of Asia. Bamboo Floor Durability Bamboo is processed in a few different ways to make flooring. 'Stranded' bamboo is by far the largest portion of the bamboo floor market. It is made by shredding the stems into long strands and then pressing them into the final solid shape using heat and plastic binders. It's available as tongue-and-groove flooring that's nailed, or the click-along style, the same choices for most laminate and design plank floors. The hardness and durability of stranded bamboo flooring exceeds that of any domestic solid wood flooring available. The dozens of colors available allow you to choose flooring that is shady like cherry, ash, oak or just about any other wood species. However, since stranded bamboo doesn't have natural wood grain, few will mistake it for the right deal. If you want a floor to have the real look of bamboo, choose 'horizontal' bamboo flooring. Instead of being shredded, the bamboo stalks are cut into thin strips, which are then laminated together to form the boards. You can see the grain and nodes (the 'knuckles' on bamboo stalks) in the floor. However, horizontal bamboo flooring isn't nearly as loud as stranded, so it's not the best bamboo choice if your floor will get heavy use or abuse. The least expensive bamboo option is designed bamboo flooring. It has a thin layer of bamboo laminated on plywood, the same type of construction used for other engineering flooring. (You won't find too many choices in this category.) Is Bamboo flooring a good choice? Bamboo does have some downsides. Because it is grass, not wood, it is affected by moisture more than other floor choices. This will swell significantly more than wood or other types of flooring, so avoid installing it in damp areas. And unlike wood flooring, bamboo can never be shed and refinished. You can find bamboo flooring at any home center, but if you want to see a larger selection, go to [lumberliquidators.com](#). You can order it there or use the store locator if you prefer to shop in person. Bamboo flooring is a hard, stable, and reliable flooring material with a pleasant exotic appearance. It has several unique features. For one, it has exceptional liability that allows it to have blunt impacts without denting or bending - in this feature it surpasses the most hardwood material. hardwood material. In addition to its better elasticity, bamboo is surprisingly difficult. It has a Janka rating of about 1800, which is significantly more difficult than that of white oak (1360) and maple (1450). Bamboo Flooring Because bamboo grows in tropical regions, it has an organic resistance to water. But it expands and contracts with changes in its moisture content, and it can stain. If you are going to use bamboo in a bathroom or a kitchen, it may be wise to apply an extra layer of polyurethane or wash after installation to ensure a permanently flush and stainless surface. Check with the floor manufacturer and/or use your installer for the right products. As with regular wood floors, bamboo flooring comes in solid and design tongue-and-groove strips and boards, meaning there are bamboo options available for both plywood and concrete subfloors. Because of the thinness of the bamboo stalks, solid-bamboo flooring is actually composed of bamboo strips that are laminated together. Engineering bamboo flooring has a veneer of bamboo over low plywood. There are also click-along varieties that consemble merely by break floor pieces together, but are warned that these often do not wear as professionals a look once they are installed. Although bamboo is naturally light in color, it can be darkened by steam and pressure in a process called carbon. (Be aware that carbonization is said to mitigate bamboo by as much as 30 percent, resulting in a floor product that can be less resilient.) Some manufacturers also offer a variety of lead bamboo flooring, as well as hand-scraped options. While bamboo flooring is now widely available, not all bamboo is created equal. Low-cost bamboo is generally made from stems that have yet to fully mature, meaning the plant has not developed the density necessary to make an acceptable floor and will easily torture and dive.
