They mention SuperMemo, but don't describe Piotr Wozniak's contribution to learning software- as the first person to develop corsageed back software (SuperMemo) and author of The Book of Effective Learning: 20 rules of design knowledge The authors clearly draw on his work heavily, but they don't mention him in introductions or even describe this book is 4 stars in quality but their failure to recognize how much precedence in rehearsals leaves a very bad taste in my mouth. They mention SuperMemo, but don't describe Piotr Wozniak's contribution to educational software- as the first person to develop corsageed repetition software (SuperMemo) and author of the book Effective Learning: 20 Rules of Design Knowledge The authors clearly draw on its own To a large extent, but they don't mention him in familiarity or even describe his role. 2. They describe a rule to put things in the software back in a reboot that is quite familiar: as a rule of thumb, you spend about five minutes during your life reviewing each card. So if you're likely to spend more than five minutes in your life looking for a fact, it's worth making a ticket. This 5-minute rule was created by Gwern here [20repeti...] long before this book was published and yet there is no mention or mention of it, although Gwern has also done a ton to popularized spaced back software. I hope the authors put the introductions into their book and correct that disregard. Aside from that ethical issue, the book is good. This clearly explains the benefits of SRS and gives sample workflows for how to keep up with an intensive curriculum. ... A nicer overview of principled learning techniques and basic ideas of learning. It's nothing new but it does a good job of presenting the best research techniques and gives very specific and practical ways to apply them into your learning medical school schedule. Nice reading about how we learn and the best learning techniques it gives a clear plan for new medical students to do well on their board and school exams. The frame structure presented in the book was my favorite part. Great book for anyone preparing or already in medical school. Great book... As the upcoming M1, your book coming out this summer could be a lifesaver for me. I've always wanted to match in the dram but I've never done the best grades. Hope to make it with a more structured system... — Victoria, a medical student I've been waiting on for some time, and I'm now at the end of MS1 in a 1.5 yr preclinical curriculum. - Farid A, medical student- Everything I read was fantastic. I was especially excited to read your part about organizing information, and the analogy to trees in the woods in Chapter 9... It really helped the exam, and it's wonderful that you emphasized the importance of organizing a framework for information in your book. I'm glad I'm starting to focus on the frames and the big picture (and hitting it before I move on to more detailed layers) now, but I wish I'd read your book... Before med school. — Nathan B., medical student
