Pink weeping cherry tree seeds

Crying Higan Cherry (*Prunus subhirtella pendula*) The crying Higan tree is a beautiful flowering tree that bears fragrant pink and white flowers in the spring that attract bees, butterflies and birds. Higan Cherry weeping grows from 20 to 40 feet tall. It is an ornamental flowering tree native to Japan. It's one of the longest-lived cherry blossoms. Soil type: Requires full sun floor and well drained. Zones: 5 to 8 Germination range: 60-80% Stratification Requirement: Seed requires 30-60 days of warm stratification followed by 90-120 days of cold wet stratification. Indoor planting: If your seeds require stratification or scarification – do the recommended pretreatment before planting indoors. Planting Instructions: Fill a container with the initial seed mixture about 1/2 inch from the top. Place your seeds from 1 inch to 1 1/2 inches below the ground surface. Gently water the seeds to keep moist, not wet. Heat and humidity are essential for germination. Germination can occur in 1 week or up to 3 months (depending on the species). Place the seed container in a heat ester under the growth light(s). Keep your growing lights on 14 hours a day. Keep your carpet warm 24 hours a day. Once your seeds germinate, move each seed in its own container under the growth lights and on the heat carpet. Keep your seedlings indoors for 2-3 months before transplanting outdoors in the spring (May to June). Outdoor planting: If your seeds do not require stratification: the best time to plant seeds of trees and shrubs outdoors is after the last frost in your area (spring). In the northern states – the best time to plant seeds outdoors is from May to June. If your seeds require pretreatment: you must plant your seeds outdoors before the soil freezes in your area (late September to early November). Its seeds will be stratified naturally during the cold winter. Germination usually occurs in May or during the spring season. Crying cherry (*Prunus subhirtella*) also known as crying Higan cherry, does better when grown in the U.S. Department of Agriculture plant areas of hardness 5 to 8b. All *Prunus* seeds have what is known as drunken-dormancy – latency that is not the result of a hard outer seed layer. For this reason, the seed requires a period of cold stratification to break latency. Start the period of germination of cherry seeds by crying at any time of the year. It can take up to a year to germinate. © 1996-2015, Amazon.com, Inc. or its Image not available forColour: Image not available forColor: Item location: Saint Michaels, Maryland, United States Publication at: Worldwide Excludes: Angola, Cameroon, Cayman Islands, French Polynesia, Libya, Mongolia, Guyana, Panama, Mauritius, Brunei Darussalam, Chad, Madagascar, New Caledonia, Bahamas, Bermuda, Iran, St. Kitts-Nevis, Western Sahara, Bolivia, Laos, Laos, Laos, Laos, Laos, Sudan, Guadeloupe, Venezuela, Somalia, Burma, Cuba, Republic of Reunion, Yemen, Barbados, Belize, Liberia, Sierra Leone, Central African Republic, Martinique, Dominica, Niger, French Guiana, Saint Pierre and Miquelon Cerezos, including weeping cherry, can be grown relatively easily from seeds, as long as simple steps are taken, the most important of which is to refrigerate their cherry trees before planting them. Cherries can be started in pots indoors or planted directly on the outside soil once any possibility of frost has passed. Plant more than one well to ensure the success of at least one viable tree. Remove the cherry hole and wash any remaining cherry meat. Wet a handful of peat moss and place it in a plastic bag. Place your cherry trees in the bag under the wet peat moss, seal the bag and place it in your refrigerator for 10 weeks. Remove the bag with the cherry seeds from your refrigerator and plant its holes. If planted indoors plant in a 50/50 mixture of organic fertilizer and garden soil. Plant the hole 1/2 inch deep and place the pot where it will receive direct sun for several hours each day. Cherry trees, including weeping cherry, can be grown relatively easily from seeds, as long as you take a few simple steps, the most important of which is to cool your cherry trees before planting them. Place your cherry trees in the bag under the wet peat moss, seal the bag and place it in your refrigerator for 10 weeks. If you plant exit doors choose a place that is well drained and you get plenty of direct sun. Rotate the floor with the shovel to loosen the floor at least 8 inches deep. Add approximately 50% organic fertilizer to the soil and mix well with your shovel. Plant your 1/2 inch deep wells and water well. Keep soil moist but not too wet. Be patient. It may take 4 to 8 weeks for your cherry to sprout. After 1 year, either transplant the weaker trees or thin the weaker trees, leaving only the most resistant. If you plant exit doors choose a place that is well drained and you get plenty of direct sun. Rotate the floor with the shovel to loosen the floor at least 8 inches deep. If desired, you can cut a 2-litre bottle of soda in half along and use half of it as a makeshift greenhouse to encourage your outdoor seeds to germinate more quickly. Quickly.
