An antistatic device is any device that reduces, inhibits or otherwise inhibits electrical discharge, or an ESD, which is the accumulation or release of static electricity. [1] [2] ESD may damage electrical components, such as computer rigid gears, and even ignite flammable liquids and gases. There are many methods of neutralizing static electricity, different from usage and efficiency, depending on the program. Antistatic factors are chemical compounds that can be added to the packaging of an object or object to deter the formation or release of static electricity. [3] In order to neutralise static charge in a larger area, e.g. in factory floors, semiconductor cleaners or workshops, antistatic systems may use electron emission effects, such as coronary discharge or photoemission, which introduce ions into an area that connects and neutralizes any electrically charged object. [4] In most cases, in the case of electrical earthing, sufficient esd protection can be provided. Symbolism Various symbols are found on products indicating that the product is electrically sensitive, as are sensitive electrical components, or that it offers antistatic protection, like antistatic bags. The availability symbol ANSI/ESD standard SB.1-2007 is most often visible in electronics-related applications. Several variants consist of a triangle with an reaching hand, depicted inside it, using a negative space. In character versions, hands will often be forwarded as a warning for the protected component, indicating that it is sensitive to ESD and must not be touched unless antistatic precautions are taken. In the next version of the symbol there is a triangle, surrounded by an arc. This option is a reference to an antistatic protective device, such as an antistatic wrist band, rather than a protected component. As a rule, it does not have a forwarded hand indicating that it makes contact with the component secure. [5] Circle A label on an antistatic bag with a circle symbol on the left and reaching symbol on the right Another common symbol is a bold circle intersecting with three arrows. Derived from the U.S. military standard, it was adopted throughout the industry. It is intended to depict a device or component that is violated by static charges specified in the arrows. [5] Types of antistatic devices: Antistatic bag Basic Article: Antistatic bag Antistatic bag is a bag used to store or transport

electronic components that may be damaged by ESD. The ionizing tape, sometimes referred to as a static tape, is a type of industrial equipment used to remove static electricity from the production line to disperse static adherent and other phenomena that would disturb the Line. This is important in the manufacturing and printing industry, although it can be used in other areas. [6] [7] The iodine rods are usually hung above the conveyor belt or other apparatus on the production line where the product can pass below it; distance is usually calibrated for a specific application. [4] The bar operates by throwing out the ionic corona on the products below. [4] [8] If the line product then has a positive or negative static charge when it passes through an ionized aura created by the bar, it will attract the correspondingly charged positive or negative ions and become electrically neutral. [8] [9] Antistatic clothing Antistatic boots Antistatic clothing or antistatic clothing may be used to prevent damage to electrical components or to prevent fires and explosions when working with flammable liquids and gases. [quote required] Antistatic clothing has a wiring thread, creating a portable version of the Faraday cage. Antistatic clothing is trying to protect ESD-sensitive devices from harmful static clothing, such as wool, silk and synthetic fabrics, from people working with them. For these clothes to function properly, they must also be connected to the ground with a strap. Most clothes are not conductive enough to provide personalized grounding, so antistatic wrist and foot straps are also worn. Antistatic clothing is used in many industries such as electronics, communications, telecommunications and defence programs. [quote required] Antistatic mat An antistatic floor mat or ground mat is one of many antistatic devices designed to help remove static electricity. It does this with controlled low resistance: a metal mat would keep parts grounded, but short open parts; insulating mat would not meditate on the ground reference and therefore would not allow grounding. Typical resistance is from 105 to 108 ohm between points on the mat and the ground. [10] [11] [12] The mat should be grounded (grounded). This is usually done by connecting to the ground line in a power socket. It is important to release slowly, so a resistor should be used to ground the measure. The resistor, which also allows high voltage chargers to drain into the ground, also prevents the risk of impact when working with low voltage parts. Some ground mats allow you to attach an antistatic wrist strap to them. Versions are designed to be placed on the floor and table. Antistatic wrist strap Antistatic wrist strap, ESD wrist strap or ground bracelet is an antistatic device used to safely ground a person working with highly sensitive electronic equipment to avoid the accumulation of static electricity on their body, which may cause ESD. It is used in the electronics industry to handle electronic devices that can be damaged by the ESD and sometimes work with explosives to avoid electrical sparks that could set off an explosion. It consists of an elastic fabric tape with fine conductive fibers woe in it, attached to a wire with a clip at the back to connect it to the ground conductor. The fibers are usually made of carbon or carbon-filled rubber, and the strap is tied with a stainless steel clasp or plate. They are usually used in combination with an antistatic mat on the work table or a special structure of diffuse plastic laminate on the surface of the work table. [quote required] The wrist strap is usually worn on a non-dominant hand (left wrist for the right hand). It is connected to the ground through a mistaken pull-out cable and 1 megohm resistor, which allows high voltage rechargeable to flow, but prevents the risk of impact when working with low voltage parts. If there is a higher voltage, additional resistance (0,75 megohm 250 V) is added on the way to the ground to protect the wearer from excessive currents; it is usually a 4 megohm resistor in a roll hook (or, more often, 2 megohm resistors at each end). [quote required] Wrist bands for industrial use are usually connected to ground connections built into the workstation through a standard 4 mm plug or a 10 mm press pin, and consumer strips often have a crocodile clip for land connection. In addition to wrist straps, ankle and heel straps are used in the industry to crucify the accumulated charge from the body. These devices are not usually tied to the ground, but instead include high resistance to their construction and work by dissipating the electric charge into special floor tiles. Such straps shall be used when workers are to be mobile in the work area and the grounding cable is placed on the road. They are especially used in the operating system, where oxygen or explosive anesthetic gases are used. [quote required] Wireless or dissipative wrist straps are available, which claim to protect against ESD without needing ground wire, usually air ionization or coronary discharge. They are widely considered ineffective[13][14][15] if they are not deceptive and samples have been tested and proven not to work. [16] [17] All professional ESD standards require wired wrist bands.
