It even deals with the latest research and provides a useful and timely reference to professions working in the fields of machine vision, image processing and pattern recognition. Robot Vision, which has grown into mit's author course, provides a solid framework for understanding work and planning future research. Its coverage contains a lot of material that is very significant for engineers who apply machine vision methods in the real world. For example, figures on binaryimage processing help explain and suggest how to improve many available commercial devices. And the material of photometric stereos and the expanded Gaussian image point the way to what may be the next impetus for commercializing results in this area. Many exercises complement and expand text material, and an extensive bibliography serves as a useful guide to current research. Content: Image and image recognition. Binary images: GeometricalProperties; Topological properties. Areas and image segmentation. Image editing: Continuousimages; Separate images. Find the edges and edges. Stability and color. Reflection map: PhotometricStereo reflection map; A shape from Shadowsting. Motion field and optical flow. Photogrammmeters andStereo. Pattern classification. Polyhedral artifacts. Extended Pictures. Passive navigation and structure of movement. Movement. Bin.Berthold Klaus Paul Horn's parts are assistant professor, Department of Electrical Engineering and Computer Science, MIT. Robot Vision is included in the MITElectrical Engineering and Computer Science Series.
