

Check signal cable on samsung tv

Samsung's 55-inch TU8000 deals in recent years, Samsung's 8 Series has been a great option to go to for TV buyers and want to balance performance and price in a way that once seems unimaginable. The TU8000 doesn't really represent the top of that range, but is just one step down, sharing plenty of TU8500 boasts, but with an even more attractive price tag. It uses Samsung CRYSTAL LCD UHD tablet technology, ensuring ease of use, minimalist design, choice of built-in voice assistant and best-in-class smart TV system. There's also a whole host of screen sizes to choose from, so you can really make it work for your space. Although its frame is mostly made of plastic, the TU8000 is a really well-built TV. It's a shame samsung has decided to use a tough position to host widely on this model and also encapsulation the HDMI inputs - especially when one of them becomes unusable if you decide to mount it on the wall. Still, there are no such controversies over the smart TV system, which includes all-on-demand and catch-up apps you could want, including Netflix, Amazon Prime Video, Apple TV and Disney Plus. There is even the state of the artistic environment included here, which appears outside the QLED range for the first time this year. There is no doubt that the image, detailed, solid motion processing and good scaling. It needs some tweaked settings to perform to the best of its ability, though. As is so often the case, the audio performance in the TU8000 is not much to get excited about, but it is also not the worst we have heard. Overall it's just on the flat side, with little in the way of dynamics and organisation, but offers a decent amount of weight that stops it from sounding too thin. Soundbar won't go wrong, but projecting the sound it manages and the clarity in the price range would almost allow you to skip it if your budget is tight. For the price, the TU8000 offers good performance requiring some managed expectations. Peak brightness is limited so HDR isn't at its best and colours don't have the pop you'll see on more expensive sets. But the details are fantastic, black levels are strong and overall it's a fascinating natural image that holds its own against the competition. It may not be as impressive as last year's RU8000, but pay some attention to the image performance that offers brilliant value. (Image credit: Versity Burns) Price and availability available in six different screen sizes, from 43 inches to an 85-inch version reviewed here retails for £599/\$500/AU\$1,299Overall cheaper than last year's RU8000S Samsung TU8000 available in the U.S., U.S. and Australia. Besides, the line is the same in all areas, including 43-inch, 50-inch, 55-inch, 65-inch and 75-inch models. We reviewed the 55inch version of the TU8000 (£599/\$500/AU \$1,299), but otherwise you'll pay £429/\$350/AU \$1,299 for 43 inches, £499/\$1,200/AU \$1,299 for 65 inches, £1,299/\$1,800/AU \$1,299 for 65 inches, £1,299/\$1,200/AU \$1,299 for 65 inches, £499/\$400/AU \$1,049 for 50 inches, £1,299/\$1,800/AU \$1,049 for 75 inches and £1,999/\$1,800/AU \$1,049 for 50 inches, £1,299/\$1,800/AU \$1,049 for 65 inches, £1,299/\$1,800/AU \$1,049 for 50 inches, £1,299/\$1,800/AU \$1,040 for 50 inches, £1,299/\$1,800/\$1,800 for 50 inches, £1,299/\$1,800/\$1,800 for 50 inches, £1,299/\$1,800/\$1,800 for 50 inches, £1,290/\$1,800 for 50 inches, £1,290/\$1,800 for 50 inches, £1,290/\$1,800 for while UK prices are generally the same, the US and Australia have seen some price cuts. For example, the prices for 55 inches tested here are the same model in the US, but the same as last year's RU8000 in the UK, but the same as last year's RU8000 in the UK, but the same model in the US and Australia comes in at \$150 and AU\$300 cheaper respectively. Samsung TU8000 specificationsScreen sizes: 43-, 50-, 55,65-, 75 inches, 82 | Receiver: freeview HD | 4K: Yes | HDR: Yes to | Panel Technology: LCD | Yes, Tysen | Curved: No | Dimensions: 1231 (width) x 783 (hour) x 250 (d)mm | Weight: 14.2 kg | 3D: No | Inputs: 3xHDMI 2.1, 2xUSB, 1xRF, CI slot, | Yields: The powerful and stylish 1x opticalDesignS although being mostly plasticchall standing is embarrassing to accommodate three HDMIs and is a bit stingy at this price, it's probably not surprising that the design of the TU8000 consists mainly of black plastic, across its rear panel, and stand panels. It still manages to feel well built though, with some soothing weight when getting it out of the box, and a minimal frame to ensure the set still looks stylish, plastic and all. Why Samsung has decided to give broad legs on this model though — or any TV for that matter — is anyone's guess. Central stand, as found on the TU8500 model above it, is so much easier to accommodate when it comes to placing larger TVs on furniture. As it is, UE55TU8000 will require a TV stand of at least 103 cm, so make sure your current installation can accommodate it first. Of course you can choose a wall to assemble this TV instead, and there are no ugly lumps or bumps on the back to make it a problem. In fact, only six semen thick, it should sit pretty close to your wall. However, it is worth noting that one of the HDMI ports will become unusable in this position due to it being turned back, which is a shame given what has been a rather stingy proposition. We're used to having four HDMIs to choose from, even at this price, but the TU8000 only has three. This means even a fairly modest installation of top water, a Blu-ray player and a games console will use these parts from the start, with one lost if the set is mounted on the wall. Other ports include two USBs, intricate video, RF antenna input for national TV, CI slot and ethernet port for when Wi-Fi doesn't cut it. There's also... Output to push the audio to a sound seps. As is usually the case with Samsung TVs, two signs are included in the box - one thicker for a standard look and a thinner, simpler option. The latter includes al the key features you won't use. This includes a ring-shaped D-pad, channel and volume controls, Netflix shortcuts, Prime Video and Rakuten TV, and buttons to turn on Samsung ambient mode (more on that later), your voice assistant of your choice, and general navigation. You can also set this remote control as a universal control for your other devices, which you will be prompted for during initial installation. (Image credit: Versity Burns) Smart TV (Tizen)Setting up an easy TV using smartthings appTizen is still one of the best smart TV systems out there andAmbient mode is included while you can get the TV set only using the remote control if you prefer, Samsung asks you to download the Samsung SmartThings app to do it digitally instead. It works really well, even automatically adding Wi-Fi information it digs from your device so you don't have to mess with on-screen keyboards, which are always welcome. It also asks you to download more on-demand apps you want on TV and choose your voice assistant, as well as helping you set up OneRemote as a universal control for all your sources. Once completed, the TU8000 will appear as an in-app SmartThings device next to any other compatible device you might have at home. You can then control the TV by phone if you lose the remotes... Or just can't be bothered to get up to get them. Samsung has long offered one of the most comprehensive smart TV systems using its Tizen platform, and that hasn't changed in 2020. It has had some small design changes since last year, but navigation is pretty much the same and is still just as simple as before. This means the Home button will bring up a host of your installed apps, which are now smaller to fit more on the screen, and highlighting each will have a secondary line of suggested content or actions. This content will be customized to your viewing habits if you're signed in to this particular app, so Netflix will offer to continue what you last watched, for example. Pretty much every on-demand service you could want is present, including Netflix, Amazon Prime, Apple TV, NowTV, YouTube and Disney Plus, as well as all of the UK's catch-up services, from BBC iPlayer to My5. There's also an app store to add other apps, including UKTV Play, BBC Sounds and Spotify, with the order of apps you add to your home menu that can be completely customized to your preferences - now you can fit 14 on the screen at any time. Scroll down from this main app bar and you'll be completed to the Samsung Content Center, with rows of TV and TV recommendations, though Limited number of vendors. Most of the options that came up for us seem to be from Apple TV, Chili or UKTV Play and while it was interesting enough, it's a shame not to see more popular sources included, like Netflix, Amazon or BBC iPlayer. We didn't find ourselves using it at all. You get two options for voice assistance, Alexa and Samsung's Bixby (Google Assistant is coming soon). Alexa can work in tandem with any Amazon speakers they might have, and is usually the better choice of the two for generic voice assistance, though Bixby offers more through specific TV controls, such as changing input via voice. It still feels like a bit of cumbersome inclusion that we've rarely found the need to use, but it's there if you want it. Samsung's environmental status is now standard in the TU8000, with the feature expanding its horizons beyond the QLED range for the first time this year. It's a feature adapted from Art Mode that was first launched as part of Samsung, allowing you to get a selection of your own artistic images, templates or images that appear on the screen when you're not watching TV. The TV sensor will detect the brightness of the room and adjust the image accordingly, so it looks more like an image than a TV that just stays that way, which saves power. You can also set a schedule to make sure it turns off after a period of time. It's not as convincing to Samsung's frame as graphics, mainly because the TU8000's screen is more reflective, but it's nice to see the feature trickle down the range nonetheless. (Image credit: Samsung) Image qualitySyrp, detailed imagePanel is not the brightest, so HDR can struggle with UpscalingDecentIs UE55TU8000 is capable of a very good image for its price, but the ready-to-summon settings out need some work to figure it out, especially with HDR content. That's because the peak clarity of this set is on the low side. Even with brightness appeared high in settings, you'll likely find yourself wanting more, especially with dark scenes in well-lit rooms. So before we talk about the picture, let's talk about how to make it look its best. The first thing to adjust here is the state of the image, which is the most accurate under film. Many will prefer standard's cool, opatic shades, which are also slightly lighter, but if you're looking for the most accurate image and color, the film is the go-on option. Movie mode includes its brightness and contrast that dropped a touch from the maximum size, and we recommend keeping them there. It's a the brightness up a touch if you do, though you can push the brightness up a touch if you feel you need it. The color tone is a shot between Warm1 and Warm2, ensuring that the differences are always at 0 to prevent further noise. You can keep color and tint settings where they are. We would normally recommend Any image processing added for the purest image, but in this case, Samsung's contrast enhancer works wonders for giving this image the oomph added it needs, especially in darker scenes. With SDR content, you'll get more impact, although with less subtlety, set high. The TU8000 will detect each time you play compatible HDR content and switch to HDR mode automatically, so that all settings you change at this point remain in place for HDR content only. Finally, motion settings are under an option called image brightness. Select Custom, and you can set the sentence settings yourself. Something around 3 or 4 seems to work best for most of the content we've watched, and the movement is, for the most part, remarkably stable. With the picture where we to work best for most of the content we've watched, and the movement is, for the most part, remarkably stable. With the picture where we want it to be, we settle down with a 4K stream of Joker on Sky Q. Contours are incredibly crisp and there are heaps of details to go on, from the texture of the makeup on Joaquin Phoenix's face to the details in Gotham's buildings in the opening scenes. More talented sets (read: more expensive) will offer a little more by way of depth and fine detail especially, but for midrange TV, there's very little to mumble about here. Colours are also well judged, and there's enough natural punch here to keep the picture fascinating. The TU8000 even does a great job with skin tones, a tricky balance that TVs of this level can't always manage. The lack of a wide range of colours for HDR in the TU8000 even does a great job with skin tones, a tricky balance that TVs of this level can't always manage. The lack of a wide range of colours for HDR in the TU8000 means you're unlikely to amaze the vitality of the TU8000 when watching HDR, but the more subtle way it handles colours and its influsion is still beautifully done. While colors probably won't be described as living, they're also far from washed away. (Image credit: Versity Burns) If there's an Achilles heel here, these are dark scenes, watching them in anything but a very dark room. Even then, they struggle to impress, as the screen tries to balance the dark and light parts of the scene. No doubt blacks can go deep, but shadow details and highlights lose in the process. As a bright set at the edge with no local dimming, the TU8000 was always going to struggle in these scenes much more discernment. This is especially helpful with HDR content. When streaming Ozark from Netflix, we were able to turn past dull dark scenes when watching daylight into something much more punchy and fun. You'll even be able to experience this hotel, but you're not cloudy yet but... With the high set contrast enhancer, the highlight details are displayed much more vividly alongside deep black ones, with very little blossom. It even helps to get out some details that would otherwise be lost in the shadows. Like The extra processing does away with some noise. However, at this price, it's a trade off we're willing to do. The result is not as accurate or dynamic as HDR can be at its best, but you won't find many TVs at this level doing much better. Just note that, as is the case with all Samsung TVs, there is no Dolby Vision support here, only HDR10 and HDR10 are less spotty+, plus HLG for broadcast. With the Amazon Prime stream of Iron Man 2 and tu8000 is doing remarkably well. Its inflation is pretty good, and if it can't switch to an original 4K, there's still a good level of detail to get your teeth into, with no extra noticeable noise. The colours are treated just as well here as in HDR, so the red and gold of Iron Man's suit stands out fairly without being over, while the contrast in darker scenes remains striking with a helping hand from the extra processing. Even national SD TV content seems decent. It's a bit soft on detail, as you might expect, but even with the extra noise creeping in, it's a solid image with a good colour balance that's totally watchable. The only drawbacks to all this are the viewing angles, which are annoyingly tight. Sit too far from the axis and you'll lose quite a bit of contrast and color spat, which keeps the overall image performance away. If this is the TV for you, just make sure the central seating location bag for movie night. (Image credit: Samsung) Audio performance20W stereo speakers3 settings to choose from not terrible, but nothing to write home on the TU8000 offers three audio settings to choose from Not terrible, but nothing to write home on the TU8000 offers three audio settings to choose from Not terrible. settings. We love the whallop added from Adaptive, which strikes a good balance of adding some weight to the low end without losing too much clarity through the price range. That low end still lacks the intensity and depths you'll get from a sound pole, but at least helps give some presence to the soundtrack and ensure it doesn't sound too thin. The treble is still a bit on the sharp side but not so much that it becomes uncomfortable to listen to. Organization is not the best so dialogue can get a little lost in the busiest scenes, but overall it's ok, if a small detail is missing. As is usually the case with TV sound, especially at this level, it is simply a bit flat, lacking the dynamics with which to switch between the subtleness required for guieter scenes and the oomph required for the greats. You want to invest in Soundbar for that. It does a good job of projecting the sound though, so you don't have to push the volume out of its comfort zone, which is At this level. Should I buy Samsung UE55TU8000? (Image credit: Samsung) Buy it if... You want Good Value TV 8 series of Samsung has always been a great middle ground for those who want a good TV without spending money on the QLED range. That's certainly what you get with the TU8000, and while there are some areas we'd like to see improvements in, there's no denying the value of a 55-inch TV at \$600/\$500/AU \$1,299. You make use of Samsung's Tizen on-demand apps and is one of the best smart TV systems you can get, and it comes with the most impressive app lineup on the market. If you subscribe to the video on demand service, it will be here, as the whole of the UK catch up services too. You'll never mumble the sentence again There's nothing on TV... You want a good choice of screen sizes you can say it's a popular TV for Samsung, by the amount of screen sizes offered. This means that whether you're looking for a main TV or a secondary set, there's a screen size (and budget) for you. Don't buy it if... You want to see the best of the low overall brightness HDR and lack of wide color gamut on the TU8000, not to mention the fact that Samsung does not support Dolby Vision, limiting how well this TV can show the HDR content. Some changes in settings can help make it a little more influential

but the real benefit of HDR won't shine here. You have a wide viewing area and viewing angles are not the strong point of this TV. If you have a lounge where people watch this TV from a variety of sitting positions, they will get a very different experience from someone sitting directly in front of them. You have a small TV stand and these wide legs make this TV a little harder to populate on more compact stands. If you're pressed for space and need your TV to have a little more understanding of it, the TU8000 may not be the TV for you.
