## Power outage philadelphia area

By Benny Taylor power outages can cause serious problems for your computer. If power suddenly shuts down while you're working, you may lose valuable data, but the problem could easily be deeper than that. Your computer's operating system should always be turned off using the correct procedure to avoid damage to system files. You can keep your computer running at least long enough to save work and shut it down properly during power outages using a continuous power supply (UPS). UPS has a large battery that provides backup power to your computer when a power outage occurs. A continuous power supply is used in the same way as any power strip or surge protection. Plug it into the power outlet, then plug the components that it will protect into the sockets available on the UPS. Some UPS sockets will provide both battery backup and anti-tank protection. They should be used for PCs, monitors, and maybe one or two other devices that you want to protect against sudden power outages. Additional slots can only provide surge protection without the need for battery backup and phone jacks or two are usually provided for mutation protection. If power is lost, UPS will continue to power your computer for as long as possible with available battery capacity. This may be just a few minutes. The more devices expected to back up, the less time can provide support. UPS is generally designed to keep the power supply running long enough to allow you to shut down your computer safely, not running your computer equipment for an extended period of time. When choosing UPS, consider which device you plan to support with a spare battery during a power outage and choose whether UPS has enough space to carry. The basic load is the computer and the screen, so you can shut down the system in an orderly way. You must also remember that UPS batteries are usually sealed lead acid batteries (SLA) and lose some space with each discharge/charging cycle. A wide selection of UPS models are available, with different capabilities and features. The longer you expect UPS to power your device, the more space you need, and the more expensive UPS will be. Continuous power manufacturers often offer free online tools that allow you to determine how many devices you need to support and for how long, so you can consider models with the appropriate capacity. While some UPS devices simply provide backup power, others include software that supports communication with your computer to report UPS status and automatically shut down your computer when charging is running low. Buy ups with enough space to support your most essential computer equipment long enough for an orderly shutdown. If you want more capacity to keep working, it will be expensive. If you believe that any power outage will be concise, UPS devices aimed at the consumer market are generally capable of meeting your needs. In more unusual situations where power outages can occur frequently and prolonged, and you want to use your device, you'll need to consider using a variety of premium UPS products, which may be powered by a fuel-powered backup generator. 1/14 Robert MaxwellPower company needs to know when your service has been disrupted, and as soon as possible. Even if you think power outages are common and it can be called for it, it is best to assume otherwise and make calls yourself. Possible power outages are localized, and if you don't phone it in, no one will. Fallen trees on power lines, power poles snapped during a storm and other weather-related equipment errors can lead to minor local power outages. It is always best to let power companies know as soon as possible. Here are some great power saving tips. 2/14 Surprisingly, you shouldn't use 18th-century lighting methods when power is out. Candles are great, but they tip over, and they can cause a fire, said Jim Judge, EMT-P, CEM, member of the American Red Cross scientific advice. They also don't provide strong lighting, he said, so you should stick with a bright lantern. A candle presents a clear fire hazard but you should also be aware of the 20 things hidden in your home that are a fire hazard. 3/14 Focus Stocker/ShutterstockWhen you can't watch TV and barely have enough light to read, playing on a phone or iPad for hours seems like the only attractive option. But you should put it down to battery preservation, said Ed Lounsbury, a licensed electrician with T. Webber Plumbing, Heating, Air & Electricity. Save your phone until you need it, he said. If the power is out for several days, you may need it for emergency services. If you can't resist opening the app, make sure you use a mobile phone charger in case your battery runs out. Check other ways to stay safe and dry during thunderstorms. Also, make sure you know how to extend the life of your phone charger. 4/14 The Handyman familyYou should actually unplug your electronics before the storm hits, because lightning strikes create a huge surge and can damage your device. But if you don't see an upcoming power outage, plugging in around the house can still provide protection against the power rise of the power back. It's always smart to unplug them, but there are ways to prevent them from being damaged, says Lounsbury. Install a surge protection in an electrical panel, or plug sensitive electronics into a surge-protected power strip, he suggested. Get the whole spoon on mutant protection and how to protect your house from a voltage. 5 / 14 Vadym Andrushchenko / ShutterstockThy what was said, you should still plug in a lamp while power outages. Leave a light on somewhere you'll see it when power goes back, Judge said. Check on a mutant guard who can take care of the whole house. 6/14 Andrey\_Popov/Shutterstock Every time you open the fridge or freezer door, you let the cold air out – and it won't be cooled again until the power supply comes back in. Not yet open, however, your refrigerator can keep your food at a safe temperature for at least four hours, so try to resist opening it unless absolutely necessary, the judge said. Find out how a quarter can tell you if your food went bad during a power outage. Make sure you follow this storm survival guide so that you are prepared for the worst. 7/14 The HandymanFood family in a full freezer would stay well for at least 48 hours, but that number dropped to 24 hours for half a full freezer, said Judge. Think of it this way: Your ice and frozen food are like ice bags, insulating the entire freezer so that the unit doesn't have to waste energy cooling empty spaces. Be prepared if there is a storm in the weather forecast. If you do not have a full freezer, put the water bottle in and let it freeze, recommended Judge. You can even take gallon-sized frozen bags to fill them with water and put them in. They will fill in any space. You'll want to keep these 16 things in hand in an emergency kit at home to survive a storm. 8/14 Jeff Gynane/ShutterstockDrivers can be confused at intersections when stop lights don't work, so be vigilant and come up with your traffic rules. Often when there is a power outage, people blow through intersections, the judge said. Treat it like a four-way stop, allowing the cars to drive through in the order they arrive. 9/14 Spok83/ShutterstockHopefully, you already know your generator gives out toxic carbon monoxide, so you should keep it in the open air out of the house. But even with the garage door open, a garage is still too closed and too close to your home, the judge said. Leave it at least 20 feet from home to avoid smoke. It was a silent killer, Judge said. It is a colorless, odorless gas, and it does not take long to withstand carbon monoxide poisoning. Learn how to manage 10 other daily emergencies. Plus: Follow 10 tips for using a generator to stay safe. 10/14 Because you can't leave your generator in the garage, you'll need to build a shelter to keep it safe and dry, especially in high winds or snow. The best bet is to build a wooden roof shelter on it so that it does not come into direct contact with the elements, says Lounsbury. A lot of people build them too small, and it ends up melting plastic on the sides. See how much gas you'll need to run generators through a storm. 11/14/ShutterstockBecais/ShutterstockBecais before a big storm, you can be sure that your panties are stocked with nonperishable food, but don't forget about bottled water. If if power outages mess with the water system and cause boiling water warnings, you will want to have safe drinking water in hand. The judge recommends having one gallon of water per person per day without electricity and having water for pets, too. If you do not want to cover out for the store to buy water, the Judge recommends pouring and washing old soda bottles or other large bottles to fill them with clean water before the storm hits. Check out the storm kits to see what else you need to keep in hand. 12/14 Family HandymanYou may be tempted to hook up a portable generator to your home's main dashboard or dryer socket so that it backfeeds electricity for your entire home. Don't do this. You won't be the only one to suffer if something is wrong. It is absolutely dangerous because if they don't turn off their main breaker, they are putting electricity over the grid, says Lounsbury. Workers trying to fix the problem will not expect such a high voltage and could end up with a deadly shock. For everyone's sake, play it safe and use your generator as intended. Learn the truth behind 11 deadly electrical myths. If necessary, learn how you can turn your truck into a generator. 13 / 14 Nor Gal / ShutterstockKh do not be surprised if your radio or battery-powered flashlight will not work when you need it most. You may think the battery is dead, but it could be a deeper problem, the judge said. Over time, those batteries that will filter acid will get into contacts, he said. To ensure your device stays fresh, he recommends having rechargeable LED flashlights in hand for emergencies, but keeping the batteries out of other lights and radios until you need them. These 21 tips, like keeping flashlights glowing in the dark, can help you prepare for a natural disaster. Originally published as July 28, 2020
