Aera conference 2020 call for proposals

Conference calls are useful for arranging meetings with a group of people in different places that need to decide. A group of lawyers may have to meet and decide a strategy for their client's case, or a group of Bachelorettes may try to plan a wedding shower. Conference calls can help a group of people decide within minutes, which may take several days via email and may be impossible to do personally. Identify the person you need to invite to a conference call. Then prioritize the importance of each person's presence. If there are three or four people calling your conference call, prioritizing the invitation list may not matter. But if you invite six or more people, it is more likely that there will be scheduling conflicts. Make sure that important decision makers will be able to attend. Contact important attendees to identify scheduling conflicts. Find out if and when those people are going out of town for an extended period of time, on board and are unavailable to call or otherwise be unable to attend. Arrange the time of your meeting around this conflict. Send invitations to all participants. Use email, Evite or other invitation software programs. Microsoft Outlook can schedule meetings, send invitations, and allow invitations to accept or decline. You'll quickly get a general idea of who can attend and who can't. Invitations may have suggestions about the time that works better for them, and they can also send you agenda items in their response to the meeting request. Check your invitation based on the feedback you receive. Schedule your meeting using the call-in service. There are a number of companies that specialize in hosting conference calls, such as FreeConference and InstantConference. If your company often schedules conference calls, find out if your company has a contract with a specific call service. Send a finalized invitation to all participants. Send invitations even to people who declined the original meeting request, if they are later available. Make sure you include all the important information in the invitation, including the date and time of the call, country code and phone number that participants need to use, as well as any required participant codes. Also include your phone number so participants can contact you directly if they have trouble dial-up. Tip If you've never used a conference call service before, ask around about call clarity and ease of use. There are a number of free services and some are charging Compare fee-based service prices and decide which best suits your company's needs. Making international conference calls is not much different than making regular conference calls. In fact, making international conference calls easier than its sound. Same basic principle applies: Participants dial into call access numberThey entering the access code or PIN for their ConferenceThey joins the conference The only difference with international conference calls is that international participants need special access numbers to avoid paying expensive international rates for calls. Many larger conference call services offer international toll-free numbers to access conferences. Others set up local access numbers in countries around the world where customers typically do business [source: Premiere Global]. For example, let's say you're in the United States and you want to have conference calls with colleagues in France, Israel and Australia. All parties need to dial either an international toll-free access number or a local access number. Callers using local access numbers are instantly pasted into the central conference bridge via the global IP network [source: Premiere Global]. Another option to save money when making international conference calls is to use an outgoing dial system instead of a dial-up system. With an outgoing dial system, the moderators of conference calls tune in to each participant individually, absorbing the cost of each international call. This method is very useful if the moderator has access to cheap international call rates, perhaps through a VoIP service. The future of international phone calls is clearly going towards VoIP. But for people who aren't willing to give up their landlines or mobile numbers, we're seeing some dual-mode phones that provide the best of both worlds. Two-mode handsets roam seamlessly between cellular networks and wireless Internet networks. And a biennial VoIP mobile phone, as offered by Skype, can make and receive calls via landlines or the Internet. For more information about making international calls and related topics, see the links below. Related HowStuffWorks Article By Nathalie Gosset Updated September 26, 2017 Call conference was created by Bell Labs in 1956 and introduced to the public by American Telephone and Telegraph (AT&T) at the 1964 New York World Fair. Called Picturephone, this invention invites visitors to speak to people thousands of miles away in Disneyland in Anaheim, California. The ContextBell Laboratory of History first developed a raw version of the concept in 1956. This is a visiting force as the Internet does not exist and digital communications are still in the realm of the imagination. The room size computer is the front line of development. The Picturephone invention includes a small screen connected to the phone. Visual and audio information has been sent on three phone lines at the time of can handle the required bandwidth even for small black and white screens. Pictures are sent every 2 seconds. ApplicationThis technology intended for verified by that appreciates the savings of travel expenses by facilitating virtual meetings. The hope is that the conference call capabilities will move to the residential market where this capability can be provided for a fee. However, the complexity and price are challenging this insight. IssuesA conference calls are placed with Picturephone monopolizing three phone lines and no other conversations can be carried simultaneously on the same line. This broadband-hungry technology stands as an expensive solution not only for consumers (\$125 monthly service and 21 per minute) but also for phone companies. Complicated control of the conference call system discourages users from entering this in the way they do business. Finally, customers moved away from this product and AT&T left it after investing about \$1 billion in its development. EvolutionWith starts digital communications, a conference calling taking new forms. Today, the common settings for conference calls refer to phone conversations involving three or more people calling from different locations. Visual touches through the computer screen may be included. Participants dial a regular phone number that acts as a conference bridge between everyone. These capabilities are frequently used in business environments and are available at home for a fee. Therefore, AT&T is ahead with Picturephone given the state of the technology of the 1960s.
