Colorado asthma and allergy highlands ranch

Address: 2490 W 26th Ave, Ste A120 Denver, CO 80211 *The entrance to our office is off Alcott Street on the west side of building A. Address: Highlands Ranch Medical Plaza II 9331 S Colorado Blvd, Ste 100 Highlands Ranch, CO 80126 While we are working to get back up and running, here are several other areas of WebMD that may be useful: Welcome to Allergy and Rock Asthma Consultants! We provide specialized medical care to patients of all ages with Allergies, Asthma, Food Allergy, Hives, Hay Fever, Drug Allergy and Sinusitis in Colorado! Allergy and Asthma Consultants is proud to serve the Denver metropolitan area, with our wheat ridge and Highlands Ranch offices auged by an outreach satellite in Castle Rock. We strive to provide State of the Art Allergy and Asthma Care and promote wellness through disease education! Our team is dedicated to providing a pleasant and informative experience. We're accepting new patients in all our locations. HIPAA Announcement: Our practice fully complies with the newly binding Health Insurance Portability and Accountability Act. Since we use this site for informational purposes only and collect patient-specific protected health information, our policy statement is available through our clinic in written form. Notice on privacy of personal health information. PHONE CONTACT: Thanks to IP telephony (Internet Protocol) you can now contact us at any of our Metro Denver offices by dialing only one number, (303)-761-4343. Any of our capable teams can help you with any details of office location. Our Allergy and Immunology Center is one of the largest in its kind, with more clinic rooms and space for food/drug challenges than any facility in the region. The Center is dedicated exclusively to the management of pediatric patients with allergic and immunological diseases. Our specialists in pediatric allergy and immunology believe that the best way to improve the quality of life of young patients is a multidisciplinary approach to the management of allergies and immunological diseases. Our outpatient, emergency and inpatient services at Colorado Children's Hospital include a variety of pediatric subspecialists, strengthening our ability to provide a full spectrum of care. We provide pediatric knowledge for children with allergic conditions and immune deficiencies. Our multidisciplinary specialists in pediatric allergy and immunology work together to treat these patients and understand the causes of these conditions so that they can provide better and more comprehensive care. Conditions we treat in our Allergy and Immunology Center Areas of pediatric specialization include: Atopic dermatitis/eczema: Atopic dermatitis/eczema is a common itch, scaly, red rash, often found in the folds of the elbows and knees, but also on the face and other parts of the body. Eczema is most often a self-employed standalone but in a small percentage of cases, this may be a symptom triggered by other allergies. Food allergy: A food allergy is an adverse immune system response to a food protein that can result in symptoms affecting different parts of the body. Asthma (including exercise-induced asthma): Asthma is a lung disease that causes the airways (respiratory tubes in the lungs) to decrease narrowing, making breathing difficult. Vocal cord dysfunction: Vocal cord dysfunction (VDC), also called paradoxical vocal bending movement, happens when the vocal cords spasm and do not become open as they should when breathing, and sometimes when they breathe. Allergic and non-allergic rhinitis: Animal allergens, pollens (trees, grasses and herbs) and molds can cause symptoms such as sneezing, stuffing, postnasal drip or itching/red eyes. Chronic sinusitis: Chronic sinusitis occurs when a child has chronic nosesymptoms caused by bacterial infection, typically lasting more than two weeks. Allergy to medicines: Medicines can cause allergic and non-allergic reactions. An allergist can help determine whether the reaction is severe enough to prevent in the future, or if the reaction was due to other factors. Sensitivity to insect bites: Insects containing poison that can cause allergic reactions include bees, wasps, wasps, yellow jackets and fire ants. While some bites can cause mild reactions, some can also cause anaphylaxis (a severe allergic reaction). Animal allergy: All dogs, dogs and other furry animals can cause allergy symptoms. They can affect the eyes, nose, lungs and skin. Animal allergies are caused by proteins in your hair and in your hoof (dead skin that is spilled); these proteins are also found in animal saliva (spit) and urine. Angioedema: Angioedema is swelling of the skin and tissues under it. This can be triggered by a food or environmental allergy, but most commonly it is part of a viral disease, or simply as your own diagnosis where there is no trigger. Acute and chronic urticaria (hives): Hives are red, itchy elevated in spines characteristic of an allergic reaction, which can be acute (lasting less than six weeks) or chronic (lasting more than six weeks). Hives can be caused by food or medicine, or other skin irritants. Anaphylaxis: Symptoms of anaphylaxis include two or more of the following: itching and hives, swelling of the throat or tongue, difficulty breathing, dizziness, stomach cramps, nausea, vomiting, diarrhea and blood pressure drop (which can result in shock and fainting). Anaphylaxis needs to be treated immediately and may require evaluation in an emergency room. Immune deficiency Severe (SCID): ICD is a life-threatening disease in which T cells and immune system T cells fighting the child's disease are absent or broken. Children with SCID are susceptible to serious, frequent and unusual infections. Combined immune combined (ICD): ICD is a group of serious diseases of the immune system in which affected children are susceptible to serious, frequent and unusual infections, but not typically to the same degree as SCID. Antibody deficiency disorders: Antibody deficiency disorders are a collection of diseases in which affected children cannot effectively make antibodies. Examples of antibody deficiency disorders include Bruton agammaglobulinemia and common variable immunological deficiency (CVID). Syndromic immune deficiency: Syndromic immune deficiencies are genetic syndromes that affect the immune system, such as DiGeorge syndrome (22q11 exclusion syndrome). Hyperimmunoglobulin syndromes: Hyperglobulin syndromes are disorders that cause a child's body to make much of a certain type of immunoglobulin (antibody), such as hyper-IgE syndrome, hyper-IgM syndrome, and hyper-IgD syndrome. Immune disorders of dysregulation: Immune dysregulation disorders are diseases that cause severe autoimmune conditions, as well as other problems with the immune system. Examples of immune dysregulation disorders are IPEX syndrome and IPEX-like syndromes. Neutrophil disorders: Neutrophil disorders are diseases in which neutrophils (a type of white blood cell) do not function properly or cannot move properly. Examples of neutrophil disorders we treat include chronic granulomatous diseases and leukocyte strain deficiency. Complementary disorders of deficiency: Complementary disorders are diseases in which affected children do not produce certain complementary proteins effectively. Properdin deficiency is an example of this type of disorder. Natural killer cell deficiency: Natural killer cell deficiency is a type of disorder in which natural killer cells (a type of white blood cell) are absent or do not function properly. Children with natural killer cell deficiency are susceptible to certain types of viral infections and may develop a life-threatening disease called hemofarctic lymphohistiocytosis (HLH). Allergy and immunology treatment and services offered Our comprehensive pediatric allergy and immunology care include: Why choose Colorado Infant for Allergy Treatment and Immunology? We offer extensive diagnostic tests for babies and older children. Our experienced team of doctors, nurses, nutritionists, psychologists, social workers and child life therapists work together to evaluate and treat patients with allergies and immune conditions. Our team uses a collaborative approach that will incorporate your entire family and your child's primary care provider. Our immunology care team includes specialists in therapists, social workers and nursing specialists. We include these specialists in diagnosis, treatment, education and rehabilitation planning. We also work closely with other pediatric specialists in Colorado to provide with the most comprehensive care. Allergy research and immunology Our specialists in pediatric allergy and immunology at Children's Colorado are nationally and internationally renowned leaders in allergy, asthma and immunological disease research and treatments. We partner with the University of Colorado School of Medicine to provide professional education and knowledge advancement through our research. Our experts are at the forefront of evaluating new methods of allergy testing and allergy treatment. Our researchers work to understand allergic and inflammatory reactions and then seek new ways to regulate these responses safely. Our facility is also a site for the Colorado SCID Newborn Screening Program and bone marrow transplantation of patients with SCID. We are here when you need us with the same safe and high quality care we always offer, even during the pandemic. Now, in many cases, you can get that care without even leaving home because we offer virtual visits in each of our specialties. See if telehealth is right for your child A teenager in Arvada is using her health experience to help others. Emma Graziano has had celiac disease since she was 8 years old. Emma is now 17 years old and has set up a youth support group. Graziano came up with the idea and made it happen with the support of a doctor at Children's Colorado. In an international clinical study, researchers exposed hundreds of children to a very small amount of peanuts to see if this would desensitize them. Max, 11, has been allergic to peanuts since he was 10 months old. He enrolled in the study in 2016. As part of the study, her mother puts a small patch on her back. The patch is about 1/1000 of a peanut. Peanut.
