The masked man

When most people think of gas masks or masks, what they usually envision is a plastic or rubber mask that fits closely with some type of filter cartridge. The mask covers the nose and mouth. They are called air cleaning masks half masks. Depending on the chemical or biological agents in the environment, half the mask may not be enough because the eyes are very sensitive to chemicals and provide an easy entry point for bacteria. In this case, a full-face mask is called. It provides a clear mask or clear eye pad that protects the eyes as well. Air cleaning masks have two advantages: They are the least expensive option. They are the least complicated option. The problem with air cleaning masks is that any leak in the mask makes them ineffective. Leaks can come from a poor fit between the mask and the user's face, or from a crack or hole somewhere on the mask them ineffective. Leaks can come from a poor fit between the leak problem. Air respirator is provided using the same type of filter cartridge found in the air filter mask. However, instead of placing the filter directly on the mask and asking the user's lungs to suck air through it, the filter attaches to the battery-powered container to escape, instead of allowing polluted air from the environment to penetrate. Obviously, positive pressure creates a much safer system, but it has two drawbacks: If the battery dies, so do you. Continuous airflow through the filter means that the filter means that the filter does not last long. However, for infants and children, this may be the only option as their small faces make it reliably difficult for masks to fit. The best system is called the SCBA system (closed breathing device). If you've ever seen a full-face masked firefighter with an air tank on his back, then you've seen a SCBA system. The tank provides constant positive pressure for the mask. SCBA provides the best protection, but there are the following problems: Heavy and bulky tanks. The tanks contain only 30 or 60 minutes of air. The tanks must be reloaded using special equipment. The SCBA system is very expensive. For firefighting, a SCBA system makes a lot of sense. The smoke is thick, dangerous and contains an unknown mixture of toxic gases. Flames can consume most or all of the oxygen in the air. Fire trucks can bring more tanks or rechargeable equipment, and firefighters spend a limited time in the burning building. However, for civilians or for soldiers on the battlefield, The SCBA system is almost impossible to manage because of the limited cost and air time.
