Text wrap indesign table

There are three approaches to creating a table: from scratch, converting existing text to a table, or importing a table from Microsoft Word or Excel. Draw a text frame from a drawing using the Text tool, or insert a text pointer into an existing text frame. Choose Table > Insert Table. Specify the number of rows and columns, and click OK. Optionally, if the table contains more than one column or frame, specify the number of (repeating) header or footer rows. Each table cell is like a text frame. You type or paste text or place text in a table cell just like you would in a text frame. You can also paste or place a graphic (File > Place) in table cells. Note If you add a graphic larger than a cell, the cell height zooms in to accommodate the graphic, but the cell width remains constant, which causes the graphic to extend beyond the right side of the cell. If the row is set to a fixed height, a graphic that is higher than the row height causes the cell to be overdue. Convert text to a table If you want to convert text to a table, it pays to set up the text correctly by using the tabs that separate the columns and paragraph phrases that separate the rows. When the caret tabs and phrases are in the right place, select the text and choose Table > Convert Text to Table. It's rare that you want to, but you can also reverse this conversion by inserting the Text tool into a table and selecting Table > Convert Table to Text. [See full-size image] [See full-size image] [See full-size image] Import a table It makes no sense to reinvent circles: If you already have a table in a Microsoft Excel spreadsheet or Microsoft Word, select File > Place to import it into InDesign while preserving formatting (probably not a good idea), or removing formatting, the information will appear as tad-based text, and then use the InDesign Table tools to prettify it. Select the Entire Table Selection table to change the formatting of all table cells. To do this, move the pointer to the upper-left corner of the table as it becomes southeast pointing to the click arrow. Alternatively, when the pointer is inside a table, choose Table > Select > Table (Cmd+Option+A/Ctrl+Alt+A). Splitting tables between large tables frames can be painful, but fortunately, if the table is higher than the text frame in which it is located, you can thread the frame with another frame in the same way as a regular text frame thread to continue the table. Keep options determines how many rows should stay together. You can also specify where the line will be broken, example, at the top of a column or frame. If you want the header or footer row to repeat information in the new frame, choose Table > Headers and Footers. If you didn't set up a header or footer row for the first time, you can easily convert an existing row to a header or footer row by selecting Table > Convert Rows Rows To the header or footer. Tip: Tabs in the Tables When you work in a table, pressing the Tab key moves the cursor to the next cell. If you want to insert a tab into a cell, choose Type > Insert Special Characters > Tab. [View full-size image] You can change the table border stroke and add alternating strokes and fills to columns and rows by adding borders, strokes, and fills to a table in the Table Options dialog box. To make an intricate table easier to read by using a broad measure, use alternate strokes and/or fills to help the eye track along rows of the table. Depending on the nature of the data, you can experiment with alternating patterns. Fills or strokes can be applied to every second row, every second row, every third row, or, using the First and Next menus, to come up with a custom row pattern. The same applies to columns. Note Unless you select Keep Local Formatting, the formatting previously applied to each table cell is replaced with row and column formatting. [See full-size image] Confusingly, row strokes are set to even when the remitual pattern is set to None. To turn off row strokes, column strokes, and table borders at the same time, select the entire table, and then point the stroke swatch at the Swatches palette or at the bottom of the tool palette, and then select None. To turn off row strokes only, select Every second row as alternate pattern, and then select None as the color of the first and next rows. If you want to enable line strokes but want to change their weight and/or color, make sure you change both the first and next lines. Similarly, when working with column strokes: they are enabled even though the inch pattern is set to None. To change the stroke weight, select a different inch pattern and change the options for the First and Next stroke weights. Tip: Tables and text wrapping Text wraps do not work in tables without first jumping through several hoops. Let's say you have the graphics and text that you want to wrap around this graphic, and you want to insert both elements into a single table cell. Create a text frame and graphic outside the table, and then group them together (Cmd+G/Ctrl+G). Select the group, and then copy and paste the relationship between the type and the graphic into the table cell. I imported the image into a frame created in a cell. Can I wrap text around a graphic in table cells? It seems that it would be easy to use text wrapping with the image inside the table, but it is harder than it should be. The short answer is to use anchored objects and apply text wrapping to the anchored object. How to wrap anchored object text in Table 1. Select a photo with a black arrow and cut it to the clipboard. 2. Using the text tool, click inside the table cell at the beginning of the text (in the upper left corner). 3. Paste the graphic into the text, it will become a graphic in the text. 4. Select the graphic with a black arrow and go to the object menu > anchored objects > options. 5. Change from inline to custom and click OK. 6. Select the photo with the black arrow and place it where you want it to be inside the cell, and apply text wrapping accordingly. Drag the picture or object where you want it to appear in the text. Make sure the picture/object is selected, not text. (If you want, you can select multiple images/objects at once.) You can place images and other objects (such as tables, text frames, or shapes) in inDesign in several ways: simply positioning them as a distribution, as built-in objects, or as anchored objects. To control the flow of text around these objects and the space between them and the text, you can use the object wrapping option. Translating Adobe InDesign has made it easier to invite collaborators and translators to translate indesign files online. Change the language of the files without having to repair the layout again. TRY IT NOW Let's start seeing the basic options. If you want to go to a specific section, click one of the links here: Wrap text around a picture or other objectActivate a text wrapping panelInduce the Wrap Text panel, you can change the wrapping options for each object (the same options are also available on the menu bar). Click the window, and then wrap the text to activate the panel. Text wrapPingOb by default, each object placed in indesign is set to No text wrapping (A). Select an object to change this option. You can change it to: B. Wrap around a boundary: Wraps text around boundary C. Wrap around an object shape: creates a text wrapping boundary around the selected shape. This option is interesting because it can also detect the edges of the image and consequently text around it. D. Jump object: forces text above under the object (text won't appear next to the object at all) E. Jump to the next column: Forces the surrounding paragraph to the top of the next column (or text frame). Here's the result for each option: Adjust the distance between the text and the objectUse you can set the distance between the text and around the object by changing the offset values and wrap options. This creates a boundary that you can eventually personalize by using the Direct Selection tool (White Arrow to make it clearer) or the Pen tool. Detect the edges of an image when text wrappingInDesign can detect the edge of an image and generate a boundary that you can use to wrap text around it (or inside the image). Select Wrap around object shape in the Text Wrap panel, and then set Detect Edges as Type. You can customize edge detection by selecting an object and selecting Option > Clipping Path >. Wrapping text around captioned imagesGroup of objects acts as a single object. Therefore, the best way to wrap text around a captioned image is to group the image and caption, and then set the text wrapper to a group (and eventually anchor the group). Wrapping text around an anchored object or built-in objectText wrapping properties in an anchored object affect only the lines of text that follow the anchor tag, not the line where the anchor marker is placed or on the lines in front of it. Built-in objects are anchored objects, so the same rule is applied. Wrap text and master pagesTo objects placed on master pages, you can set text that always wraps around the image (by default, when text wrapping is active), or only text placed on the master page by activating apply only to master page. Wrap text and hidden layers By default, a wrap object affects text frames in all layers, even when its layer is hidden. To change this behavior, select Suppress text wrapping when the layer is hidden in the Layer Option dialog box. This option may change the state of text in other layers. Ignore text wrapping in a text frameAjo set text frame to ignore any wrapping option:Select text frame. Click Object and select Text Frame Options (Otherwise, you can press Cmd + B on MacO or Ctrl + B on Windows) Select Ignore Text Wrapping. Wrap inside a picture or shape (reverse text wrapping)You can use the Invert option to wrap text inside a picture. Select the object that you want to wrap inside. Set wrapping around the object shape and detecting edges as a type. Place text over the shape. The offset can be adjusted to suit your to make text pass through borders or add space between text and the edge of a shape. In addition, you can personalize wrapping boundaries by using the Direct Selection tool (white arrow to make it clearer) or the Pen tool. Incorrect text wrapping behaviorIf indesign gives you a headache with text wrapping, see this checklist by InDesignSecrets to problem, or feel free to drop the comment below.
