Cosmetic animal testing persuasive essay

Animal testing has a long history during which it has helped in important discoveries in the field of medicine and pharmacology, prevent people from harm or even death from ineffective or unsuitable products. Undoubtedly, the procedure has done a lot of good for humanity in terms of protecting and improving human health. It would therefore be fair to acknowledge that there have been times when animal testing could be regarded as irreplaceable as having a high objective for which animal suffering is a reasonable price. Today, however, is no longer the case and there are obvious and indisputable reasons for this. For starters, animal testing is cruel. Animals are kept in horrific conditions that presuppose constant painful and life-threatening experiments. Dripping chemicals into the eyes and skin, force-feeding or killing with lethal doses of potentially harmful substances to humans are common

cosmetic testing procedures. Noticeably, many of these tests would never lead to anything useful or bring benefits for a person and expose animals to needle torture. (All you need.) In addition, those who are not yet eager to accept the moral side of the debate, would definitely acknowledge the scientific argument for why animal testing should be abandoned. First, animal testing is not as accurate and effective as one might think. The results of experiments on animals are not applicable to humans. The reasons include the fact that the human body can react quite differently to a substance than an animal. Cases when people have suffered life-threatening side effects that were not present in animals are numerous and known. An important factor here is that animals are kept in laboratory conditions that can affect results through the elevated amounts of stress they experience, altered diets and even temperatures. (All you need.) Also, the predominant majority of all tests are carried out without anesthesia or analgesics, which nevertheless has minimal scientific value. In addition, animal testing can provide little information about the long-term effects on the human body and therefore puts people at risk of the appearance of unknown side effects. (Failure) Furthermore, animal testing is expensive and can be replaced with reasonable alternatives. Specifically, according to estimates, testing for a single substance is likely to cost more than \$6 million and assumes the use of more than 800 animals. At the same time, computer modelling techniques and in-vitro methods are much more effective and cheaper. Artificial corneas or skin can be used to perform credible tests without any harm to living things. Today, the development of new technologies and the continued interest of research that understands that animal testing is not effective from a scientific point of view reliable alternative methods. It should become a new stage in cosmetic testing. Taking into account all the arguments, it is clear that animal testing should be abandoned as it has reached the limit of its usefulness which could at least partially justify its use. With the current development of civilization, ideas of humanism and technology it is hard to believe that someone can still believe that animal testing is an acceptable measure. More importantly, its effectiveness and reliability are objects of great doubt. This is the right time for people to reconsider their habit of recklessly and recklessly using each individual resource to meet personal needs, if not from moral considerations but for logical and scientific reasons. The first records of conducting experiments on living things date back to ancient Greece and Rome. Animal testing has been used for centuries and has resulted in many scientific discoveries, but today people no longer need this controversial practice. Discussion on this topic and high school is under way, and students are often tasked with writing a compelling essay on animal testing. The topic is not easy because both sides of the debate claim to use compelling arguments. In this article you will find a lot of useful information that will help you write a powerful essay on animal testing arguments that will impress your audience. How to write a compelling essay on animal testing? Animals have been used in medical experiments and other scientific research for several centuries. Many people still think that these experiments are extremely valuable for discovering drugs, great advances in human health and the development of new cosmetic products. But with the growth of the modern animal rights movement, many people began to think that it was unethical to use living things, keep them captive and make them suffer from physical pain, emotional stress and deprivation. In 1975, Australian philosopher Peter Singer published his piece Animal Rights where he argued that animals deserve to be treated with similar care to human beings because they feel pain and suffer only we have. The American philosopher Tom Reagan argued in 1983 that animals have intellect and emotion just like humans, so people should protect their rights. Today, such experiments remain commonplace and, according to PETA statistics, more than 100,000,000 animals are tested and killed in laboratories each year in one country alone – the US. However, public support for such cruel practices has been steadily declining. Amid ethical concerns, many countries, such as the European Union, Norway, Israel, India, have passed a law banning the use of animals in testing cosmetic products. When writing a compelling essay on animal rights, you should examine the opinions of both advocates and opponents of this practice, take a stand and defend your position. To help you write this type of essay as well as a compelling essay on testing cosmetics on animals, we will discuss the main arguments on both sides. First, let's list some of the main arguments used by proponents of experimentation. Animal testing has helped develop a bunch of life-saving drugs for many diseases, for example, diabetes, childhood leukemia, brain injury, breast cancer, tuberculosis, malaria and more. There are no appropriate alternative methods for researching complex living organisms such as humans and animals. Animals are genetically similar to humans and are susceptible to the same diseases. Experiments are regulated by special, strict laws that protect animals in laboratories from mistreatment. The results of experimentation are useful for animals. We will now talk about the key arguments of opponents of this controversial practice. Animal experiments are cruel and inhumane because they are subjected to terrible procedures such as toxicity tests, water and lack of food, force-feeding, wound infliction and murder in various ways. These are the most obvious reasons because all living things deserve to live without suffering. It's an old method. Due to the advancement of technology, researchers can use scientifically proven alternative innovative methods to replace the need for animals. All living species are unique. There are significant cellular, metabolic and anatomical differences between animals and humans, so research is far from fool-proof and often yields irrelevant results. According to statistics, about 90% of experimental drugs fail in human clinical trials. Experiments involving animals cost millions of dollars and are more expensive than other alternative methods. And all living things that participate in these tests die so it's just a waste of time, money and other resources that could have been spent on research that delivers results relevant to humans. There's no need for tests like this. Animals suffer as human beings and die in laboratories without protection from cruelty to create new pesticides, erectile dysfunction drugs, food or eyeliner. No one needs these products so badly that they should come at the expense of someone's lives. Social relevance, efficiency and ethical issues make modern scientists in the way of innovative alternatives, and now there are some promising options that can reduce the need for experimentation. All these alternative high-tech methods are now a reality and are much cheaper, faster and more efficient. Here are some examples: Researchers are working to build computer models (algorithms) that can analyze vast amounts of research data and predict how certain products can affect living organisms. No living thing is in danger. There are cautious methods of human studies like microdosing when human volunteers receive new drugs in small quantities that allow researchers to measure their impact on individual cells. They're safe and efficient. In addition, volunteers have the freedom to choose and understand what is happening to them, including the effects and are motivated to help scientists find cures for diseases. Simplified and miniature organs on chips that mimic the functioning of human kidneys, lungs, heart and liver can provide more human relevant results in toxicology and help understand the effects of new drugs. In vitro testing, when researchers use human cells to see through microscopy how they respond to certain chemicals. We have provided you with a brief overview of the discussion and differing views on the matter. But you should do additional research to find more evidence of experimentation to help you make an educated decision on which side of the debate you support. A lot of information about the problem is available online, so you should look for the internet and find more data and examples to illustrate your point of view and support the key points you will argue in your compelling essay. You need to find compelling facts that can prove your position right and will help you convince your audience to change their minds and support your ideas or take some action. It's a compelling essay so you can use descriptive storytelling techniques or metaphors to appeal to the emotions of your readers. You should formulate a strong and very specific statement about the thesis and create a detailed blueprint to help you stay focused throughout the writing process and you will keep your essay on track. Follow the traditional structure of the essay that includes introduction, body passages, and conclusion. If you use quotes or paraphrase someone, be sure to list all your sources and create a list of references according to the requirements of a specific citation style assigned to you by the instructor. You have no idea what to write? We have strong themes for your essays! Best Topics for Compelling Animal Testing Essays Review these interesting essay topics for testing animals and feel free to use them for your papers. You can use the arguments we discussed in this article or think about your own. Under what circumstances can animal testing be justified? Is it ethical to buy cosmetic products tested on animals? Animal research and medicine. Is it ethical to genetically engineer animals? Should animal testing be banned? Animal experiments: pros and cons. Why is animal testing cruel and inhumane? How can technology replace animal research? Alternative approaches to animal experimentation used to assess risks to human health. Why are the results of animal experiments not reliable? Why should we support cruelty-free cosmetics brands? Why is animal testing an outdated practice? Arguments against animal testing. Why are animal rights important? Are there any benefits to using animals in research? A cruel history of animal experiments. Animal rights in relation to animal welfare. Should animals be used in scientific research? Can we work on science without animal experiments? Why do people use animals in research? The truth about animals used for experimentation. Why is animal experimentation unethical? Sample a compelling essay on animal testing Finally, here's a short sample of a compelling essay against animal testing. Despite advances in technology, more than 100 million animals have been damaged and killed in outdated and barbaric scientific and commercial experiments conducted in laboratories around the world. Experimentation on animals is cruel, unreliable and dangerous and should be banned everywhere due to adverse consequences. Currently, millions of dogs, cats, birds, primates, rabbits, rats, mice are locked in small cages in laboratories like prisoners, although these innocent creatures have committed no crime. They live in isolation, deprivation and misery. All they can do is wait in fear for painful procedures to be performed on them without any painkillers during cruel cosmetics, drugs and chemical tests, curiosity-driven experiments at universities and medical training. They can be burned, undergo repeated surgeries, drug-addicted, drowned, starved, brain damaged, poisoned, force-fed chemicals and more. In the end, almost all poor living things will be killed. Often such tests bring the wrong results and are unsafe for humans. These experiments are just a waste of money and resources because there are innovative alternative methods that are faster, cheaper and safer for people and the environment. You can help stop this cruelty. Take a stand by boycotting companies that torment animals in inhuman experiments. You can't find the inspiration to write the perfect essay on testing at We have a bunch of motivated writers who want to help you! A few clicks and the evening is yours! Your! Your!
