

Portable word processor

Subscribe to blog updates with email » UPDATE (8/31/2015): I loved the form factor, an Alphasmart NEO that I feel a much nicer keyboard, upgraded and (unfortunately) displays a little more genre 🙂 Technology has done a lot easier about typing. In Evernote, you can save, easily write, and write small sedis of information, and you don't need to go to libraries to do research. But technology didn't make it easy to concentrate and write. This doesn't need an explaining. Twitter. Facebook. 'enough said enough. Would you like to double your creative output? Click here for my free tool » So this piece of junk is a \$19 investment. A small portable word processor called the AlphaSmart 3000, made for use in classrooms in 2000. It was cut, but you can still buy used amazon. That's great for writing shit about a piece of technology. Efficiency isn't all about mind management, it's about time management, it's about time management, and this stack of plastic helps me keep my mind on the right brain state for writing. 1) AlphaSmart doesn't connect to the internet if you bike a computer for a mind, then a bumper car for a computer mind connected to the internet. Sometimes, it's bad to be able to suddenly send your brain to the far corners of cyberspace. For example, if you want to write. If alphaSmart 3000 is all kinds of bikes, it is a fixie (with a banana seat and flamas). It doesn't connect to the Internet, and that's probably the worst part. Sitting in front of your AlphaSmart 3000, there is no Internet. It's just thoughts and keys in your fingers. This is perfect for writing. 2) AlphaSmart is small, almost useless, the screen has no 27-inch Thunderbolt display here. Instead, a jagged font has a small LCD screen that shows four lines of your writing. Also, this piece of shit screen is down the road on the keyboard, so you have the crane down the neck to look at it. It's much better to look into space or close your eyes. This small screen makes the AlphaSmart 3000 big for one thing: writing. You don't think what you just wrote. You're just thinking about what it says. 3) AlphaSmart editing donkey AlphaSmart 3000 has a number of whack-ass properties for editing a pain. There's a spelling check that moves with the urgency of a snail with a head cold. It also has the ability to choose text, copy and paste with agility of an amber-coated mosquito. These features mean that there is no editing of this shit along with its small screen Junk. AlphaSmart 3000 sucks for editing. You know what it does? Write. Writing and writing. 4) AlphaSmart is not connected to the cloud. (It hardly connects to your computer.) I hate to tell you this. Whatever you're writing, your first draft probably sucks. Hemingway even supposedly said: Something first draft shit. -Ernest Hemingway So, stop treating the words of his first draft from The Golden Boy like water drops on that stage. The most important thing produced in most first drafts is not the writing itself, but the connections you make in your brain. You can sleep on them and rewrite everything in your favorite cloud-based software the next day. Although you would be to write a magical first draft, you can always hook the AlphaSmart 3000 via USB and import the inscription. Still, I'm warning you, it sucks. You should sit there and wait while this insignificant part literally rewrites what you typed into a document on your computer. It's still worth it. Why? Because it's great for writing stuff. Great things about this piece of junk this thing just didn't win an important point in my creative arsenal of suckiness. There are some things that beat your laptop: It has batteries. They're as good as this man. Pressing the on/off button will cause you to type and write within 5 seconds. Your job is ALWAYS SAVED. You may find yourself hitting Cmd+S on alphasmart, but it doesn't matter. Your article is saved instantly. Just power to write a few notes, then power it off immediately and get back what you're doing. I keep my AlphaSmart 3000 useful in my living room. My most creative time is in the morning, when I'm still slucky. I can catch him, sit on my couch and prepare my thoughts in a few seconds. Best of all, there's nothing to distract me from. Browser windows do not open the day before, there is no request to check for iMessage or Software Update notifications, foreign interface elements, and emails. The distraction factor is so low that I don't need to hack these sessions for 10 minutes. Only things that you know about this neutral and good-insignificant piece, you can save work on 8 files, each accessed by pressing the file keys at the top of the keyboard. Each of these files holds data worth about 12.5 pages, a total of about 100 pages of work that you can save. Do you think you should buy a portable word processor? Here are some options. AlphaSmart 3000 there is not only portable word processor, but a good air-conditioned find (I have used my Seller Kuombell2) is the cheapest and fastest way to start enjoying the free benefits of stalling a device that is very but not good for writing. My original intention was to use this cheap purchase as an idea date, to test how I liked the form factor, then consider any more expensive options there. The form factor has certainly proven itself to be very strong, but so far, I'm still happy with my AlphaSmart 3000, and there are no plans to change it at the moment. There are a number of different AlphaSmart models available, and they don't get much more expensive about \$60. If you know you're serious about a portable word processor and want to back it up to the cloud, there was kickstarter for a product called Hemingwrite (now just Freewrite), which will be released in September 2015. But, during the campaign, the price tag was significantly higher: \$349. If you go with a different model, be sure to investigate whether you need a cable (for example, double your creative output? Click here for my free tool set » I don't write that much anymore in my daily work — I went from the Atlantic's political reporting team to the Product team - in retrospect I noticed something obvious: It's extremely difficult to write when you get out of the routine. When your editor expects three (or more) stories a week, you still delay — but you always succeed in submitting, focusing, and revealing a copy. But now that there is no deadline edition, I have found that my writing process goes through something like this: There is a vague ambition to write a blog post; Open Google Docs; Write about 50 words; Remember something I want to see on Google; Open a new tab to look at it now; Get lost reading Wikipedia or Twitter for half an hour; Close Google Docs and clear the apartment. I know SMEs that shut down internet connections to avoid being distracted. But for me, it's equally tempting to open Textmate and puzzles on a coding project. Basically, (and I'm not the only one) will get any excuse to avoid writing. Especially during meta Google procrastination sessions, Freewrite was across a freestanding word processor that bills itself as the first smart typewriter. Looks pretty neat - an e-ink displays and syncs the cloud without an internet browser to annoy you. getfreewrite.com.My colleague Ian Bogost came last year impressed with freewrite review and away. Author, I can't overstate how liberating this feels. Said. There's only one problem. Very expensive - almost \$500. Despite german engineering, this is a little much for me. But I wondered: Before cheap laptops were everywhere, maybe in the 1990s or 2000s, did anyone else already make a version of this crappier? Turns out they did. Alphasmart Neo2. This fella was first launched in the mid-2000s meet and became particularly popular in schools. (You can see this legacy in the abundance of applets related to math and spelling, accessible from the main menu.) But it also makes a great lightweight word processor, all freewrite. The keyboard is no different, about what you would expect from the 15-inch Macbook Pro, a good size. This post is satisfying if you are not a revelation. The screen is smoothly fitted with large LCD screen, text four lines (or more, if you change the font size). It's running on three anti-aircraft batteries. I use Neo2 for about a month and it still registers as full power. As an antique, it holds eight files that you switch between by tapping file 1, file 2, file 3 (etc.) only. To transfer text files to your computer, you connect Neo2 to your computer with a USB cable, which makes it an external keyboard. When you click a post, it rewrites what it wrote. (There is also a Mac utility that allows you to transfer files in a more logical way.) This weighs about two kilos - my MacBook Air.And is the best, costing just around \$40 less! You can find them on Amazon and eBay. Using Neo2 certainly helped solve my distracting problem: When I sit down to write, I put my phone in the drawer, turn off my computer and start typing. It also made power a little easier through copying. When preparing something again to change a few more paragraphs as I write. With Neo2, I can only see about 40-50 words at a time, and scroll up and down (and copy and paste), while it's a bit laborious. So I find myself writing to the end, and then I finally go back to what was done again, which feels more effective. No, don't make it easier to start writing Neo2. It's still a challenge. But once I go, I'm much less likely to stop. EDIT: Yes, I wrote this post first on Neo2! First!
