## Download amazon app store apk for android

Online mega-retailer Amazon.com is about to enter the mobile app market: the company is preparing to launch its own app store for Android smartphones, going head-to-head with Google's Android Marketplace. According to materials sent to selected developers, Amazon, such as Google and Apple's App Store, plans to pocket 30 percent of each sale, making 70 percent to the developer. However, unlike Google, whose Android marketplace is essentially free for all unedited app posts, Amazon appears to be planning to offer a curatorial experience: apps won't be able to transmit offensive content and will have to meet approval criteria. Amazon also plans to require developers not to offer the same apps elsewhere at a lower price. The second Android App Store can appeal to developers because Amazon's payment processing system is accepted in many places where Google Checkout doesn't work. Plus, Amazon has a built-in customer base: as one of the world's largest electronic retailers, Amazon already has tens of millions of active customers. Amazon also plans to allow developers to submit videos to go along with their apps to taste how they work, a move that would put it in front of the Apple App Store and Android Market. Amazon declined any public comment on plans for the mobile app store. Amazon isn't the first to plan its own Android app store: mobile operator Verizon is launching a VCast music and app store for Android devices offering curatorial apps, and Verizon's offer will be preinstalled on Android phones offered by the carrier. Mobile developers have largely embraced Google's Android Market, in part because apps aren't vetted-programmers don't have to worry about passing the infamously arbitrary and undisclosed rules Apple applies to iTunes App Store filings. (Apple recently released App Store guidelines in an effort to add transparency to developers.) But Android app developers have also expressed frustration with Android Marketplace: the comparative chaos of the Android market could give Amazon the opportunity to differentiate themselves through its customer review and technology for recommendation product services. Editors' recommendations If you've just unpacked a new smartphone or are considering using a holiday cash envelope to run it out and buy it and want to fill it with new ways to disperse, read on. Amid all the other year-end flashbacks, future predictions, and service-y listicles drawn from every media outlet on the planet at this time of year, this story could be for you. There are literally millions of applications. Apple's iOS and Google's Android each offer more than 2 million apps in their respective download stores. Each app store has its own top charts recommendations where to find the usual suspects – Facebook, Netflix, Spotify, Snapchat, YouTube and other well-known social networks, media services, transport tools and games. But there are plenty of other excellent apps out there, from dark to hard-to-pronounce, whose names may not be at the tip of the tongue when they fire up your new gadget. Last year, we published a list of seven lesser known but very useful applications. We have designed (and still highly recommend) Dark Sky for weather, Stitcher for podcasts, Giphy Cam for making fun animations, and afterlight photo editing, among others. The traffic to this post has been totally bonkers, suggesting that guides like this are exactly the kind of thing you're looking for right now. So here's another one. This time we've rounded up eight other particularly useful, fun or otherwise download-worthy apps that we've come across this year. 1 Second Everyday (iOS and Android)In the era of smartphones, almost every moment of our lives has been thoroughly documented, but most of the images we invisibly share are invisibly shuffled into the past under a flood of new posts on Instagram or Facebook. Or, in the case of Snapchat, they literally disappear forever. 1 Second Everyday treats things differently. The app is designed to do exactly what its name suggests: Capture one second of video every day-or as many days as you happen to remember to use it. The end result is a rapid-fire burst of short moments that, as they add up, offer a high-level but insightful look at what your day-to-day life looks like. It may be a light on context, but a series of clips tells a story that is otherwise difficult to capture in carefully filtered and deliberately curated photos and videos posted elsewhere one by one-and then immediately forgotten. With 1 Second Everyday, you can export a composite video and share it on your social networking choices, or just keep it to yourself as a sort of personal video diary. If nothing else, it's a useful internal reminder that a given year is more than major life milestones, holiday photos, and cringey news headlines that can come to mind most easily: Life is actually composed of many types of moments; It's just a matter of which ones we capture and remember. Download 1 Second Everyday here. Hopper (iOS and Android) The last time I wanted to escape from the East Coast for the California heat, I used an app called Hopper to help me figure out the best time to fly. Within minutes, my flight was booked. While there are countless flight-tracking and travel apps out there, few offer a combination of simplicity and data-driven predictive proactiveness quite so effectively. The color-colored calendar layout in search results gives you a clear overview of which days, weeks, and months are the cheapest time to fly. If the flight is chances are you'll get cheaper (or more expensive) in the future, Hopper tells you, spelling out the chances of various potential price fluctuations, and when that's likely to happen. You can also track searches and sign in to get notifications when bids pop up or when a hopper finds another locale you might be interested in traveling to based on previous searches. For example, your search for a flight to Miami may have yielded expensive results, but if a frantic trade on a flight to Ft. Lauderdale or Orlando pops up, you'll get a push notification right away. So whether you're planning business trips around specific dates or just trying to scratch that wanderlust itch on a whim, Hopper is one of the easiest ways to plot the most ideal trip possible. Download Hopper here. The 60db (iOS only)Podcasting Renaissance is still barreling forward, but it has a long way to go: Only 20% of Americans say they listened to the podcast. 60db hopes that digital sound consumption feels more like radio (a century-old medium that is still powerful), but also injects it with a more personal, digestible taste of modern digital media services. The result, especially built by veterans of NPR and Netflix, is something that feels like radio, but with a kind of algorithmic smarts and new content initiatives that have changed the way we now define and consume TV. 60db allows you to subscribe to most standard, publicly available podcasts you might think of, but its main focus is on shorter-form audio stories that cater to more specific interests than a general interest podcast can. These quick hits, often produced by 60db employees in concert with established media brands, offer 10 minutes or less of audio storytelling on an ever-expanding range of topics. And as we expected from services like Pandora and Netflix, 60db learns how you listen-the more you use it, the smarter it gets. There's an ever-growing selection of notable podcasting and radio apps like NPR One, Stitcher, and RadioPublic (other new offerings from public radio vets), but 60db goes out of its way to be particularly effortless and addictive. Download 60db here. Headspace (iOS and Android)The scientific case for mindful meditation is beyond well established. And between our growing addiction to apps and screens and the anxiety of an endlessly chaotic news cycle, you could argue that our brains could take advantage of rest now more than ever. Many experts advocate minimizing screen time altogether, but in those moments when you can't get away from your phone, you may also have digital tools to help you restore common sense. Headspace is popular. The app uses a combination of cutesy design, programmable reminders, and a soothing British accent by a guy named Andy to lure you away from your mindless digital distractions and into soothing state. Headspace is a (fair warning) paid subscription service that offers controlled, audio-based meditation exercises under different circumstances, but offers enough free sessions to give you the right feel for how the service works and whether it's worth paying \$13 per month (or \$8 if you're willing to pay a lump sum for a full year of access). There are, of course, several meditation-focused apps out there, such as Meditation Studio and Sattva. If you happen to own an Apple Watch, it's worth signing out of Apple's own Breathe app. Download Headspace here. (iOS and Android) Even if you're not much of a player, it can be hard to stop playing this one. PinOut is a retro-style pinball game in the style of the '80s for iOS and Android. Indeed, the more prone you are to nostalgia for the 1980s (or otherwise appreciate you may be neon design and synth-heavy music), the longer you'll be stuck to it. Its retro-electronic soundtrack sounds as if it's been ripped straight from the introduction to Netflix mega-hit Stranger Things and its vibrant, neon-laced layout of the game feel like Tron exploded in the form of pinball. Download PinOut here. Quartz (iOS and Android)You can easily read messages on your phone — whether it's from friends on Twitter and Facebook or through multiple news-specific apps, from aggregators like Google News, Clipboard, Feedly and Reddit, to publishers like BuzzFeed, the New York Times, or the BBC. But almost never did these apps break out of the traditional, headline-based paradigm of news consumption. Quartz, a business-oriented news media brand launched by The Atlantic four years ago, had a different idea. The app, launched in early 2016, avoids the familiar messaging format in favor of the chat interface. Instead of reading news stories, you talk to them. The app's pre-composed responses, often emoji-laden (tell me more or more?) allow you to name your adventure by navigating the world's newest and most important events. In an age of clickbait headlines and the uncertainty over which news stories are even real, what could be more refreshing than talking about the news with what feels like a very knowledgeable friend—even if it's just a useless bot? Download Quartz here. Nuzzel (iOS and Android)If you want to watch our strange new reality but are not in the mood to chat with newsbot, Nuzzel is another virtual newsstand with a modern spin. The social messaging app shows the articles your friends now share most on Twitter (by default, within the last hour, but you can filter them in 24 hours or travel back in time to your previous days). What Nuzzel may lack in originality (Flipboard has offered Twitter-powered news since 2010) it creates with intelligent design and flexibility. The app allows you to step outside your Twitter bubbles and novinky novinky Friends friends and browse even wider in its Discover tab. It also helpfully suggests news stories that you may have missed. Nuzzel definitely caters to news junkies first, but that doesn't mean it doesn't serve people prone to more casual headline scans. In fact, it's not even just for Twitter users anymore. Last year, the news app redesigned its service to open to everyone. In this way, we can watch civilization decipher in the seams as we do everything else: by silently staring into our phones together. Download Nuzzel here. (iOS and Android) Listening to music is one of the most obvious and common uses for our phones, so apps like Pandora and Spotify always get high ratings in app stores. But if you're a bona fide, crayon-digging music snob, chances are you're missing out on some of the latest and best music that's created. That's because before budding artists get signed to the label or pay to self-distribute their music to major subscription services, they take matters into their own hands first on services like Bandcamp and SoundCloud. And more than most music services, Bandcamp is able to justifiably make a rare claim: It actually helps independent and smaller label artists get paid. The service's main focus is on selling physical albums, downloads, and other goods like T-shirts. But even if it's not a streaming service in the traditional sense, Bandcamp allows you to listen to music, watch artists, and still discover new music. Simply keep an eye out for the app's best selling and genre-specific cards is guaranteed to discover something new and wonderful. There's no way to see SoundCloud and subscribe to the streaming service — Apple Music has amazing playlists, and Spotify's data-driven music discovery features are innovative and addictive. But don't think for a moment that your music library collection is complete until you download the Bandcamp app. that.
