## Skyrim crashing fix

Skyrim came out a long time ago, but the game still has a huge player base due to its sheer size and different number of side-searches. However, users who have installed too many mods or simply regular users encounter this strange error by regularly playing Skyrim. SkyrimSkyrim sometimes just will not work properly and the game crashes on your desktop without producing an error code of any kind that would pay attention to the solution. The corrections to this problem differ in complexity and are also very different from each other. However, we recommend that you try each of them until one of them tries you. When you play Skyrim, the game is often automatically saved during your progression every couple of minutes, which prevents you from losing progress often. In addition, there is an opportunity to quicklyown your game without too much hassle. However, you should try switching to manual recording that you created for your character and delete the rest because the error may be caused by incorrect quick recording or auto-recording. Open the game you're using and start playing. Press the Esc button to unsee the pause menu. Select the Save tab. Save progress to a new socket that you should create, and make sure you're using this saved file all the time. Learn how to always use the handheld recording option instead of autosave one to upload your games, because this feature is known to become a buggy after different fashions get involved. Navigate to this folder, where files should be saved by default:C:\Users\[UserName]\Documents\My Games\Skyrim\Saves>Delete saved files that you are not using, especially files that are automatically saved or saved quickly. Note: If you can't see some of the folders mentioned below, you'll need to turn on Show hidden files and folders from folder. Click the View tab on the File Explorer menu, and then click the Hidden Items checkbox in the Show/Hide section. File Explorer will display hidden files and remember this option until you change it again. Solution 2: Reinstall GameReinstalling Skyrim on your computer may be easy and it may also turn out to be one of the easiest possible options that you can troubleshoot by faulting the desktop error. After you reinstall the game, the settings that were incorrect and caused the error to start appearing to better check this solution should be reset. Troubleshooting the game: First, make sure you're signed in with an administrator account because you won't be able to delete apps from any other account. Back up saved files from solution 1 location by copying them to another folder because they will be removed after removing Skyrim. Click the Start menu, and then open Control Panel to search for it. Alternatively, you can click the gear icon to open the if you are using Windows 10.In Control Panel, select View as: category in the upper-right corner, and then click application in the Programs section. If you're using the Settings app, click Apps to open a list of all programs installed on your PC immediately. Locate Skyrim in the control panel or settings, and then click Uninstall.Skyrim Uninstall Wizard, which should open or, if you purchased the game using Steam, its client should open and prompt you to choose. A message appears asking if you want to completely remove Skyrim from Windows? When you have finished the removal process, select Yes.Click Finish. To reinstall Skyrim, you'll need to insert the disc that you purchased with Skyrim and follow the on-screen instructions, or you'll need to download it again from Steam. The game will still be in your library, so just right click on it and select the installation option. Check that the game still crashes. Solution 3: Improve their shadow settingsMi users claim that a random failure while playing Skyrim on the desktop can be attributed to your shadow settings. No matter how good your PC is, this problem can affect you and you can try to fix it with the simplest of all tweaks: reduce the quality of shadows or turn them off completely. Click the Skyrim icon on your desktop or somewhere where you installed it to open Skyrim Launcher. Click Options, and then click Advanced in the Details section. On the Details tab, you should see Shadow Information. Click the arrow button next to it and select Low.Open Skyrim to make sure that the error is still displayed. Solution 4: Disable ffdshow Audio and video decodersUsers suggested disabling these audio and video decoders if you have installed them on your computer, which can easily make settings for these programs exceptions in the game itself. If you can't find these programs on your computer, it means they're not installed and you can just skip this solution. Click the Start menu or click the Search button next to it, and then type ffdshow in the search bar. Click the audio or video decoder (you will need to repeat the same process for both) and wait for them to open. On the right you can see a menu that consists of several options. Navigate to the DirectShow control section. Check the box next to Don't use ffdshow in: and click Edit.Locate Skyrim.exe from the list to open, or click the Add button to locate the Skyrim executable file on your computer. Repeat the process for another unsecured decoder to verify that the error is displayed again. Solution 5: Check the integrity of the game cacheCheck the integrity of the game cache is an option available only to Steam users who downloaded the game from there. This is a pretty good fix because this option will search through your Skyrim files one and it will also automatically download all missing or damaged files. To achieve this, follow these steps: Open the Steam client and go to the Library tab. Library SteamRight-click game that causes these issues and select Properties.Navigate to the Local Files tab and click Check integrity of the game cache... optionTry runs the game and verify that the problem persists. Solution 6: Adjust Windows Audio SettingsSound audio settings in your computer's control panel is the official Bethesda fix, which seems to have helped many people experiencing random desktop failures. However, this will change your computer's sound settings, but the change will probably remain unnoticed and the error will disappear permanently. Audio issues Skyrim is a known problem. Right-click the volume icon in the lower-right side of the desktop screen (system tray), and then select Recovery Devices. In the Sound window, on the Playback tab (which has just been opened), select your default playback device (speakers). Right-click the device and select the Properties option. When the Properties window opens, go to the Advanced tab. In the Default Format section, click the arrow button next to Quality Mode, and then select this option:24bit 44100 HzThen Click OK to apply the changes, and then open Skyrim to see if crashes still occur. Solution 7: Use the following .ini FilesThe .ini extension is used for Skyrim preferences files that may be in the folder where you installed the game, and it contains all the settings that can be changed by Skyrim. You should always be careful when dealing with these types of files, because replacing them in the wrong way or deleting them can lead to serious consequences. NOTE: This solution will only work for 32 operating systems, so check this only if your Windows is 32-bit. Visit this link to find mod Skyrim which consists of modified .ini files that you need to use to set Skyrim INI Files &gt;&gt; Manual Download.The download should start immediately, so click .zip file after it downloads and extracts files somewhere in the folder on the desktop named Skyrim INI. Go to the folder below, right-click the file called SkyrimPrefs.ini, and then click Copy. Paste the file into another folder on your desktop called Skyrim Backup. C:\Program Files\Steam\SteamApps\Common\Skyrim\Skyrim or C:\Program Files (x86)\The Elder Scrolls V Skyrim\SkyrimOpen folder on the desktop where the files should be downloaded, and copy the file to the folder above. Go to the folder below, right-click the file called Skyrim.ini and click Copy. Paste the file into the same Department backup folder on the desktop. C:\Users\&lt;Name&gt;\Documents\My &lt;/Name&gt; &lt;/Name&gt;: appointment in ini folder, locate the Skyrim.ini file, and then paste it into the folder above. In this way, we have applied changes to the files that should cause the error code to disappear from your computer, but we also backed up all settings only if something went wrong. Solution 8: Disable the touch keyboard service This is discovered by a Steam user and he managed to fix the problem by disabling the service. Note that this solution applies to Windows 8 or Windows 10 users. Most other users have tested this method and the results are outstanding. Although the method may seem vague and you may have never heard of this Touch Keyboard, give this shot and you may be surprised. Open the Run dialog box using the Windows Key + R key combination. Type services.msc without quotes in the Run dialog box, and then click OK. Locate the touch keyboard and handwriting panel service, right-click it, and select Properties.Open Touch Keyboard and Handwriting Panel Service PropertiesSelect that the option of type Touch Keyboard and Handwriting Panel Service Properties is set to Off. If the service is running (you can verify that you can stop it immediately by clicking the Stop button next to the Message Service Status. Error 1079: The account specified for this service is different from the account specified for other services running the same process. If this happens, follow the instructions below to resolve it.
