Rowenta pressure iron and steamer cleaning instructions

www.rowentausa.comNotprint iron & steamers 24/08/06 10:14 Page 1Next 1 2 3 ... 8 1 2 3 4 5 6 7 8 Table of Contents 9 9 1 2 3 4 5 6 7 8 10 11 12 13 14 15 17 18 19 20 Table of Contents 21 Choose a board that can be adjusted in height to adjust it to your height. It should be stable and robust so you can place the ironing device on it. The board must be perforated so that the steam can pass through the fabric's fibers to soften it and make ironing easier. The ironing board cover cover must also be suitable for letting the flow of steam through. What is the vertical steam function used for? How do I use it? This feature allows you to iron fabrics in situ or on a hanger. To do this, set the iron temperature button to the maximum position. • Leave the workpiece on a hanger and gently pull the fabric with one hand. • Press the steam control button at intervals and move the iron from top to bottom. Since the steam produced is very hot, it softens the fibres and removes the folds. Note: Never use the vertical steam function on an item worn by anyone. Can I get steam in any environment? Yes this is because the steam is generated in a separate area away from the iron's sole. This allows you to get steam at the lowest heat setting, e.g. However, when the iron temperature control is set to the lowest setting, you must also set the steam output button (depending on the model) to the low position, otherwise water droplets may occur in the steam. How can I avoid scratching the sole plate on my iron? To avoid damaging the sole plate, follow this advice: • Always place the iron on the heel rest or its bottom (depending on the model). • Avoid ironing over abrasive objects (buttons, zippers, etc.). • Never clean the iron iron with abrasive or metallic cushions. How do I avoid shiny marks on the fabric? Shiny marks can occur on some fabrics, especially on dark fabrics. We would advise ironing dark clothes out and using the correct temperature. If you are ironing mixed fibres, set the temperature for the most fragile fibers. Important: The iron takes longer to cool down than to warm up. We recommend that you start with fabrics that need to be ironed at low temperature. What water do I need for ironing? • Tap water: The appliance is intended to operate with tap water. If your water is very hard (hardness higher than 30°f or 17°dH or 21°e), mix 50% tap water with 50% distilled water (available in stores). In some coastal areas, the salt content of your water may be high. In this case, use only distilled water. • Softener: There are several types of softeners, and the water in most of them can be used in the steam generator. But some softeners, especially those that use chemicals such as salt, can cause white or brown This is especially the case for filter jugs. If you experience these kinds of problems, problems, Suggest that you try to use untreated tap or bottled water. • Remember: Never use rainwater, clean demineralized water or clean distilled water from shops or water containing additives (such as starch, perfume or water from other household appliances). Such additives can affect steam properties and at high temperatures form deposits in the steam generator chamber, which are likely to stain your laundry and cause premature aging of the appliance. Maintenance and cleaning How do I clean the sole? • Durillium sole: Regularly clean the sole with a damp, non-metallic washing-up plate. For light, non-corrosive cleaning of the iron's sole, use a damp sponge on the sole plate while it is still warm. If there are problems cleaning dirt, use the stick specially made for cleaning durillium seed. • The stainless ironing plate: Clean the sole plate when it is cooled with a damp cloth or a non-abrasive sponge. • The autortilic sole: It is recommended that you use a soft damp cloth on the hot iron sole so as not to damage the surface. Warning: The use of iron cleaner will damage the auto-centric coating of the sole. How do I maintain my steam generator? Before maintenance, make sure that the appliance has been removed from the socket and that the sole, boiler and ironing will have cooled down (at least 2 hours after ironing). Do not use maintenance or descaling product to clean the sole or base unit. Never hold the iron or its base unit during a running tap. Cleaning the base unit: • Wipe the plastic parts from time to time with a slightly damp soft cloth. Maintenance of the boiler (once a month): • Note: To extend the efficiency of the boiler and avoid weight deposits, rinse the boiler every 10 days. If the generator has an anti-lime rod, remove it and rinse it under the faucet before placing it back in the boiler. • Use a jug to fill the boiler with tap water until it is 3/4 full. • Shake the base gently for a few seconds and empty it completely over the sink. • For best results, we recommend that you perform this operation again. If you live in a hard body of water, you should do this more often. Most of all, do not use any descaling products to clean the boiler as they can damage it. How do I descale my steam generator? Descaling is not necessary for the steam generator, but you can still rinse the boiler every 10 uses (see user manual). Never use descaling agent or vinegar when rinsing the boiler. They may damage it. • Models with weight collector: Rinse the scale collector under water. The next time you use the generator, press the restart button to turn off the orange Anti-calc light (depending on model). • without scale collector: Rinse the kettle. The next time you use the generator, press the restart button to turn off the orange Anti-calc light (depending on model). Technical support Should I be concerned about any noises from my generator? No. When you start or use the steam generator, you can hear a pumping or vibrating noise along with a clicking sound. This is perfectly normal and is only the pump that injects water into the boiler or steam valve opening. Why does my orange light keep flashing when I've just flushed the kettle? After flushing the boiler, press and hold the restart button for about 3 seconds to stop the flash of light. Steam escapes from anti-scale Valve Plug. The anti-scale valve plug can be tightened incorrectly or the seal on the inside of the cap has perished. Is it normal for the steam line to become hot during ironing? Yes. However, if you notice that the steam line is damaged, you must have it repaired by an authorized service partner. My iron is dripping. The ironing temperature must be set to the type of fabric to be ironed and set the steam output (if the setting temperature check is on Synthetic substances, the setting vapour control must be on MIN). Some water droplets drip out onto the floor during ironing. It's normal. Your iron generates a lot of steam; this steam condensate on the board. Some water droplets could appear under the ironing board and fall on the floor. Why doesn't my generator produce steam? If the boiler does not work, or if the red light on the control panel is turned on, even if there is still water left in the tank, we suggest that you check that the water tank is not empty. You can also check that the removable water tank (depending on model) is pressed into place and press the restart button on the control panel. Also steam output control dial can be set to minimum (depending on model); therefore turn the dial up to increase the steam. Why does my red water light keep flashing? If your red water light flashes, there is no water in the water tank, or the tank is not fully or firmly pushed down. Why does my generator leak? This may be due to: • Attempting to use steam before the iron is hot enough. Depending on the generator model, when ironing at low temperature, reduce the steam output by adjusting the steam output button on the control panel. Wait for the iron temperature control light to go out before ironing. • The water may also be condensed into the pipes because you are using steam for the first time or you have not used it for some time. In this case, keep the iron away from the ironing board and press the steam control button until it produces steam. • Overuse of the turbo steam function may cool the sole plate. In this case, stop using the turbo steam function and let the iron temperature control light turn on and off again before this function again. • The boiler may be too full. Don't fill it all the way to the top. Why does steam come from the iron or generator base when it is switched on but the iron is not used? The generator's safety mechanism is activated. You must have the generator checked by an authorized service agent. Brown stripes come out of the holes in the sole and stain the laundry. • You use chemical descaling products or additives in the water. You should never put these products in the water tank. If this is the case, contact an approved service centre. • Your sink has not been rinsed sufficiently or you iron a new piece of clothing before washing it. Make sure you have rinsed your clothes thoroughly to remove soap deposits or chemicals from new garments that can stick to the iron. The sole is dirty or brown and can stain clothes. • Your iron is too hot, see our recommendations on temperature control settings in the product manual. • You use starch. Only spray starch on the back of the fabric to be ironed. The iron does not slide very easily. Some laundry stiff and synthetic fibers can stick to the surface of the iron. Please clean the surface of the iron. Shortly after use, I can hear a metallic sound. The interior parts can make metallic sounds with the temperature change. There's nothing wrong with that. Is it normal to hear a rattling noise from time to time? Yes, it's normal. This is due to the flow of cold water into the boiler containing hot water. What should I do if my device doesn't work? After following the instructions in the user's manual for starting the appliance, make sure that the power outlet is working by plugging in another appliance. If it still does not work, do not attempt to remove or repair the appliance yourself, instead take it to an approved repair center What should I do if the power cable or cable guard on my appliance is damaged? Do not use the appliance. To avoid any danger, it must be replaced by an approved repair centre. Different items The steam is generated under pressure. Is there any risk? No. The pressure is at a relatively low level. The appliance has two safety systems: • A valve avoids overpressure and lets the excess steam escape in the event of a malfunction; • a thermal fuse to avoid overheating. What is the difference between a steam generator and a steam station? A steam generator is the most powerful iron, generating huge amounts of powerful steam in a separate boiler unit and pumps that steam constantly and consistently through the iron's sole straight into the garment. The advantage is that this halves your ironing time and produces amazing ironing finishes. A steam station looks like a regular iron, but has a larger water tank. The water is pumped up to the iron and the steam in the iron not a separate boiler unit. The steam output is constant, but not as powerful as a steam generator. Is lime scale a problem for steam generators? The formation of limescale is avoided because the water is not in direct contact with the heating element, which is located outside the tank. However, the tank should be rinsed after 10 applications to avoid lime scale deposits. Is it dangerous to have the water and power cables together? No. The two cables are separately insulated; they are protected and thoroughly checked. However, if you notice that the cable is damaged, you must have it repaired by an approved repair center. What is the ECO option (depending on models) for? The ECO function allows you to reduce energy consumption. This means that less electricity is used and therefore a little less steam is generated. What is the function of autoclean catalysis sole (by model)? This system prevents the sole from clogging. Its active coating eliminates fibers and impurities that often get stuck on the plate and end up reducing its slide. Where can I dispose of my appliance when it has its life? The appliance contains valuable materials that can be recovered or reused. Leave it at a local collection point for citizen waste. I just opened my new device, and I think there's a lot missing. What should I do? If you think some are missing, please call the Consumer Services Center and we will help you find an appropriate solution. Where can I buy accessories, consumables or spare parts for my appliance? Go to the Accessories section of the website to easily find what you need for your product. What are the warranty conditions for my appliance? For more detailed information, see The Warranty section of this website. Website.
