I'm in high school and I want to go to UConn. I am interested in programming and want to specialize in computer science. However, from my understanding, this major is in the faculty of engineering which requires chemistry in high school and physics. I'm taking physics now, but I dropped chemistry last year and realized That I loved programming after the truth... Does this mean I can't choose it as my home? Can I take a summer chemistry course or something to make up for it? Also, computer science requires a lot of math, and my math knowledge is about... Reparation. How much of a loser am I? I've always hated it before but now I'm open to learning it since I've realized how useful/powerful it is. It's just that I feel left behind I don't even know if I'll get accepted in the first place because my grades are good but my teacher always says that there are millions of children who are at your level and even better than you. I've had depression and social anxiety (still do) so I haven't really done any extra things like sports/clubs etc so all I have are a few AP/ECE classes and semi-nice grades. That's it. I feel like I'm drunk :(---you don't have to read after this point, I'm just paranoid/vented--- If I'm getting in though, I want to live on campus because it might be useful for someone like me with a social anxiety disorder. But I'm so terrified but I have to do it, otherwise I might end up like my mother who almost never comes out of her comfort zone and is afraid to do anything she hasn't used. But it's so scary, but I can't be like this when I grow up and feel weird, I've been practically living inside my head all my life. Very slowly I poked my head and talked to people a little bit, but that's not enough. Soon I will be 18 and I will be an adult and have all these expectations. I never did anything on my own, I don't even know how to drive. That's why I feel like everyone's lost me, looking at my friends and they all have jobs, driving cars, volunteering, they're in clubs. What's the job? What's the car? People?? Wat. I'm out of my head and I don't know what this is, that's why I'm terrified of living in a residence. Only... What do I do next? I don't know anything:(But I have to do something... I can't stay at home and there will be no social growth. I would never keep it the same anywhere. Sorry for this rant, I hope I didn't bother you guys. It's just so much easier to write all this than to say it verbally. You need to put it somewhere. Page 2 10 comments yes so I'm thinking of switching to computer science. I know this is going to be difficult. At all. I'm in business school and I know that a lot of engineers end up switching to business school. All I wonder is that if I'm not incredibly savvy in mathematics I will stand up for a chance with compsci? I know a lot of engineers who don't have much difficulty in mathematics, which is a second nature to them. But I just feel more afraid of math than I'm bad at it (although I'm not that bad). I don't care about graduation on time. I'd rather take more time to go to school now than go back to school when I'm 30. I really want to get into programming and maybe even cybersecurity but my certification in MIS would be trivial compared to cs and CSE applicants for those types of jobs and grad programs. I just know that some CS specialties switch to MIS because it's easier. And frankly being in business school it seems more like a few hoops to jump through compared to other disciplines at CLAS and ENGR. I think I'm just worried about fast food courses like Calc and Chem. Idk.Any advice from some compsci specialties here on why to switch or why not switch? Or any tips in general? I apologize for any mistakes or if it is difficult to understand that I may or may not be going through an existential crisis with what to do with my life. But yes, there was 1000 pages 2 so I managed to get 2.75 that's completely stressful 18 semester credits, and 1127 chime was awful but somehow I managed to B-, CSE1010 didn't really teach me anymore from what I learned from my /in high school but the exams were in hieroglyphiccompary compared to reviews, lectures and laboratories... The whole class. The main problem is that, from highschool I was not allowed to take many engineering reqs such as physics and calc because of the lack of space (General Yai Education) and I am currently in a crushed dispatch and I heard that the GPA requirement for CS or engineering is a huge 1 3.4 which is annoying considering my friend Muscat made just doing the same thing to me now but it was accepted so i don't have to worry about getting 3.4.Next semester restore calculus for GPA, and one easy grade. However I will be taking CSE 1729 and physics 1501 (which I have no physics background) and I wonder if anyone else has the matter? Is it still within reach? Page 2Posted byu/[delet]3 11 years ago comments using in the case of throwing this gets flak:To those who are currently in the CS program in UConn, what are your thoughts? Is the program preparing students for the real world, or at least covering important materials (such as data structures, algorithms, CS theory, application, etc. - maybe not all of these things), and doing a good job doing it? Are there any drawbacks or things that cs up-and-coming disciplines should be aware of or begin to learn themselves during school? I'm just asking. I've begun to wonder if UConn has a CS program. I've heard from a few of their peers that it's not the best, some say because of the lack of enthusiasm I've encountered, others because of the content and the app have (or in some cases) but I'd love to hear more opinions. I must mention that this is by no means an attack on UConn or anything like that. I just want to see if UConn is right for me, I think. Thank you! Page 2 69 comments I've been discussing if I should go to CSE, but I think it would be a better idea to get an understanding of the actual people who went to it or currently in itPage 2 comments oh everyone, senior hes just about to apply. I heard it was very difficult to get admission to engineering school, so CS was developed as the first major option. But I also put funding as my second option since both schools are hard to reach, will you get an apartment of no, or dumped in ACES? Also, how difficult are courses in these disciplines? Is there any benefit of choosing CSE on CS? Hello everyone, my brother has been accepted into UConn for fall 2018! What is your experience with computer science or computer engineering software? He's very happy :) Good morning. I was accepted into computer science programs at the University of Connecticut and Central Connecticut State University as a transfer student. Can anyone provide me with some insight into any one of these programs or give me an opinion there? Is anyone familiar with my state? Any feedback will be appreciated and appreciated. UCONN seems a little more difficult. I can get a Bachelor of Science Comp from CCSU in 2 years. The same degree will take 3 years from UCONN. I would like to attend a program that will: prepare me best for a career as a software developer/EngineerHas the best decent internshipshas salary/benefits you. Page 2Posted byu/[deleted] 6 years ago comments does anyone here have an opinion about the University of Connecticut for CS? I know it doesn't have a top 25, top 50 for CS, but if anyone has any idea how UCONN is in terms of career results and learning, please share. I was thinking about going to UCONN and then moving the senior year to somewhere like the University of Maryland or Urbana Champaign. Perhaps it makes more sense to stay in UCONN (instate education)?
