Lifewire uses cookies to provide you with a great user experience. Using Lifewire, you agree to use cookies. If there's one thing Microsoft is doing unquestionably better than any other tech company, it's being fashionably late, and Office 365 is a perfect example. Nearly five years after Google Docs first appeared and two years after it finally left its longest beta test, Microsoft has finally unveiled Office 365, Redmond's own cloud performance kit. But isn't it too late for someone to care? Let's look back at the annals of technology history on a few other belated Microsoft releases to see how they wanted to assess whether Office 365 came into play too late. The product that came to define Microsoft was perhaps his first and most famous example of being two years late in the lot. To be fair, Windows 1.0 at the end of 1985 wasn't that far behind the successful January 1984 release of Macintosh as the first UI graphics system, especially when you consider that things didn't flip nearly as quickly back then. And it wasn't until two versions and a half decades later, with the release of Windows 3.0 in 1990, that it really began its rise to become OS of choice for much of the computing public. By the time Microsoft threw its hat into the ring in browser battles in the mid-1990s, Netscape had already established its dominance and IBM and Apple also launched their own browsers. However, what happened next was such a complete and complete takeover of the market for one piece of software by Microsoft that the Department of Justice felt the need to participate. Netscape disappeared into the black hole that is AOL, and Internet Explorer peaked in the early 2000s when it was the gateway to the Internet for more than 90 percent of the world. Microsoft has not turned every late release into global domination. In 2001, Apple thrust the music business into the future with the first iPod. Five years later, and no longer distracted by the Ministry of Justice, Microsoft debuted zune. The company had its views on repeating the magic it made in the operating system and browser worlds, betting its time. Now we know how it turned out. By many accounts, zune is a good piece of hardware, but compatibility problems with Macs and iPod created by the cult following have proven insurmountable. To be fair, Microsoft has been in the mobile game for over a decade, but much of what it released in those years was rubbish. Mobile 6.5 as a serious competitor to the iPhone? You are welcome. If Windows Phone is an attempt by Microsoft to get serious about the smartphone market, this definitely qualifies as another example of being late. And though I'm not betting on Redmond to The industry is head-to-head, as it did with Windows, some analysts say it's a strong contender. Of course, Microsoft isn't always late. Sometimes he loses too early, too early, appears to be the case with the pills. As for Office 365, I don't know what it's going to change the world, but I also don't see that it's the epic failure that zune was. This could be the case when Google is primed the pump for cloud performance and now Office can muscle in and become the new standard. It won't be the first time. Video: Ballmer launches Microsoft Office 365 Note: When you buy something after clicking links in our articles, we can earn a small commission. Read our policy affiliate links for more details.
