Required fields are marked * Re: Shaping Abalone Shell There is no dang thing that can out-fly my ShopVac. I hunt it down in the summer for angry wasps. I use the same ear protectors I use when getting along with traps. There's no dust escaping my rap. And for that, I really enjoy what I do. From the picture, the stone rotates from right to left on the front. That throws the shell dust right into the pickup. The same goes for the rubber. I haven't found the shell thickness too much of a problem. I tried grinding out a few bumps to make the panels flatter. By holding them against the light, I could see where I had almost thinned them out too much. I go really easy when I'm shaping the circles/ovals/whatever. Don't ram it into the stone. A little, a little, and I get the shapes I need. Precious Shell has been used successfully for many years in Marquetry, Parquetry, Reverse Gilded Glass Ephemera and Commercial Signage. HEALTH-SAFETY MESSAGE: Dust from cutting, sanding, grinding, breaking precious shell and or Abalone is known to cause adverse health problems, excessive exposure to fine dust can make you seriously ill or can lead to silicosis, a lung disease that is potentially fatal. With that being said it is important to always wear the right OSHA-approved gas mask when cutting to avoid inhaling dust particles from the shell. CUTTING TOOLS/TECHNIQUES: The most common way to cut the scale when insecurng woodwork is by using a jeweler or coping saws in combination with a Dremel moto tool (small Rotating saw) and needle or mill files for best results and accuracy. Lutherie and Lapidary vendors often have a good selection of fine tools to help in the processHow To Cut Shell basic Video by Ron PercellShell can also be cut/scored with a sharp x-acto knife making some soft passes across your pattern lines until cut. This technique is used in making inlayed centers for Reverse Glass Gold-plated letters. The shell can also be masked with vinyl (rays resist mask) and sand blasted with alumina to get fine lines and detail. The shell can be coated with lacquer or varnishes and then cut underwater with scissors. Tiresaws can be used and work best with the smallest of available shell knives can also be softened in salt water then poured into shape and then clamped to be left completely dry. Keep in mind that shell is very difficult and that it may be easier to use a coping saw some corners sand or submit verses due to how hard the shell is still vulnerable. I have placed a design of a cutting board on the other side of this document, made of hardwood that can help in the use of a jeweler or coping saw. If you are creating a cutting board, make sure that the cutting board fits the tolerance tolerances your saw. EXAMPLE OF CUTTING BOARD MADE FROM HARDWOOD FOR JEWELERS OR COPING SAWWOOD INLAY:For wood inlays such as Marquetry & Parquetry, take the design you want to make and make it into a working pattern, the pattern is then used for transferring the design to the shell and wood that is inserted. The dish is then cut in the form of your design. Then, the shell is glued to the surface of the wood in the desired position for inlay with glue, such as the name brand DUJO or contact cement, carefully avoiding excess glue outside the edges of the shell. Once dry you use a sharp pointed object such as a writer x-acto knife or even a pencil to write around the edges of the shell design. After scribbling use Acetone (make sure to protect any finished surface or joints as acetone will damage them) to soften and gently remove the shell shape of the wood and to clean both shell and wood free of glue for later use. As always use the appropriate OSHA approved masks for safety purposes. Now that the wood surface is clean and free of glue, you can see the lines written on the surface in which you now start routing a mortise slot in which you place the shell. Route a trough/mortise slightly less shallow than the shell thickness is used. Once finished with the inlay mortise you Epoxy the shell in the mortises area, many inlay craftsmen use epoxy mixed with the dust of the wood is inserted to act as the glue and filler in one, to match the color of the wood as close as possible. Once your epoxy of choice has been thoroughly dried, you then use a series of sand paper (working from coarse, medium, to fine) from 80-600 grit to start leveling any excess epoxy and raised surfaces of the shell until smooth and clean. After the leveling is complete, you are now ready to complete your project with the top layer of your choice to finish your wood project. GLASS SIGNS & DECORATION:The use of precious shell was used for many years in Reverse Glass gilded for numerous areas, such as in decorative centers of letters, as well as whole letter faces, and as for filling out backgrounds and decorative boarders. The techniques for cutting are the same as previously stated. The desired designs are cut out of the bowl and then applied to their place. There are plenty of techniques for applying shell on glass based on personal preferences listed below. Some of the first techniques that were used involved embedding the carved shell in Thick Bodied Damar varnish (we recommend Gilder's Brand, 3 times thicker than Damar artists) which is well mixed with a fast drying as a hardener and resin gel as a filler to hold a heavy body to the varnish. The Damar mixture is then applied to the area and then the shell is embedded in the mixture that serves as the glue. Another technique is the use of a cathedral quality of U.V. Glue (we recommend Mark) where the glue is applied to both surfaces (Shell & Glass) is then placed in position, the U.V. Glue is then set/hardened by exposing it to ultraviolet rays from the sun or using a U.V. Light with the right amount of exposure as recommended by supplier of the glue to convert/harden. In the past shell was applied to glass using a hi-clarity cyanoacrylate known as Pacer or Crazy glue, but availability and durability are poor, and often attack enameled surfaces can leave unwanted results. A definitive method is to clear coat the shell with a heavy paint finish, then place in position and attach only the corners with a small amount clear to pin in position. This technique may help prevent de-lamination problems from using Crazy Adhesives, but does not have as high of shine as it results in the use of the U.V. Glue, which brings a wet look that brings the most staining from the precious shell as if it were wet in its native environment.
