## Lowes artificial grass seam tape

This custom-made add-awe band is the ideal partner when used with the Aqua Bond Adhesive and forms an exceptionally strong connection between section alucity connections. Made from rot-proof geotextile fabric laminated to a special coating to prevent adhesive from penetrating the bottom. Joining Tape Width = 20cm EnviroStik Aqua-Bond Adhesive & EnviroStik Joining Tape © 1996-2014, Amazon.com, Inc. or its subsidiaries Artificial Turf Installation can be completed with a few everyday tools that, if you don't have, can be purchased or rented at a local home improvement store like Home Depot or Lowes. Some of these tools are: Sod cutter, plate compressor, seam tape, flat head rake, push broom, 6 -8 rug braces /flat head nails, wheelbarrow and carpet knife. Elite artificial turf can install it for you or give you a simple guide that you can follow if you want to tackle the artificial turf system yourself. To give a brief explanation of an installation process, the following lists the steps: Excavation (preparation for your base) 1. Clear existing grass or vegetation on the surface for lawn, spray weed killer or grass blocker solution to ensure that no vegetation under the lawn area will grow in the future. 2. Once you are done, use crushed stone aggregate (we recommend a 2-3 layer of 1/4 crushed stone). You can buy this at your local hardware store or building supply warehouse. 3. Once the crushed stone is applied, make sure that the base is as flat as possible. A plate compressor or a sod roller can be useful for this step. NOTE: It is important to remember that the lawn is applied to this crushed stone base so that any wave formation is visible on the surface as soon as the lawn is applied. It is also important to remember that the crushed stone will help in the drainage properties of the system, so a slight inclination for proper drainage is recommended. Now that your base is ready, it's time to install your fake grass 4. Once you have laid the stone base, you will want to roll out the lawn according to your area dimensions. (It is important to place the lawn with all grass fibers or blades in the same direction to make sure all the lawn pieces fit together.) \*This step may not apply if you do not have multiple parts or sections of the lawn. 5. Make cuts in the fake grass with a standard carpet knife to fit the lawn on the desired area. (They essentially cut the lawn to shape to create your area, so that the fewer pieces of lawn used, the better; this will eliminate nersowing pieces together). In case you need to sew the lawn together, we recommend a 4-6 indoor/outdoor carpet seaming tape. The tape is used to attach the pieces of the lawn together and not to attach it to the aggregate (crushed stone). Next, center the seam band along the To do this, lift one side of the lawn and hold the seam tape on it, gently place the glued part of the lawn back down, place the adjacent seam on the centered tape and apply pressure (by walking) over the area. Finally, make sure that there is no overlap or bundling of tape or lawn. 6. Now you are ready to attach the fake lawn to your base. To attach the artificial turf to the base, you will want to use 6 -8 carpet staple (these are essentially long nails). In the staples 1 drive from the lawn edge and all 6 along the lawn circumference. It is a good idea to start on one side of the application so that you can tighten the lawn from the other side. This process is the most important, so your lawn is secure and properly fastened. In the staples, move around the perimeter of the area and on both sides of seams. This ensures that the seam does not appear and that the material is properly attached to the base. Remember, the carpet clamps keep the edges of the lawn in place, while the filling will actually weigh the material down. Now that your fake lawn has been laid on your base, you're ready for the final touch 7. The final step is to add the filler to your choice. (The main purpose of the filling is to give the lawn its soft and life-like properties while the lawn is loaded). We recommend a sand filling. We also recommend the use of about 2 pounds of filling material per square meter of lawn. You want to apply the filling material evenly with a drop persther on the lawn; If you don't have a drop spreader, you can do this by hand, but this process will be more time consuming. 8. Next, you will want to use a soft to medium bristle bist to work the filling material in the lawn. Work the filling material in the lawn until the lawn starts to stand upright. If you don't see the desired results, a flat head rake is also a good tool. NOTE: It is important to ensure that you brush the filling material against the grain of the lawn; This allows the filling to work its way to the base of the fibers properly. This is the precision step; You must brush the filling evenly to ensure that its appearance is consistent. A simple check to make sure it's even going across the lawn and your feet will tell you if it's straight or not. Work the filling in the lawn until the desired appearance is achieved. And there you have it! 8 easy steps to a lawn that is always green and always beautiful! And if desired, you can use stones, fences, foliage Add lights to enhance the look and feel of your new artificial turf. We promise that you will not be snared.
