display not only makes the handset smaller in volume, but also makes it difficult to carry. If you are a regular user and mainly use your smartphone to check emails, chat and browse social media apps, the 5-inch HD or Full HD display terminal is perfect.511 The smartphone's processing power depends on a number of factors such as OS version, UI, bloatware, etc. from one device to another. If you are a heavy user who needs to edit images/videos/documents online, play heavy games, stream videos or often use the app in split screen mode, then you need to check the multitasking fluid for you with Qualcomm Snapey Seconds and Smartphone 652 or Snape Second 820/821. Lighter users will be pleased with the handset that comes with the Media Tek processor, which means that a higher number of 611 megapixels doesn't mean smartphone cameras are better. Some specifications such as camera aperture, ISO level, pixel size, autofocus, etc. are also essential. A 16MP rear camera is not necessarily better than a 12MP camera. The same is true for the front camera with a 12 or 16MP sensor below f/2.0, and can shoot fast even in low light. Casual shooters can also go with an 8MP or 12MP camera with an f/2.0-f/2.2 aperture.711User interface and OS version are also key factors to consider while choosing a smartphone. This is an interface that you need to interact with each time to access everything, so it should be easy and simple. For the most basic and pure Android experience you can buy a Motorola handset, Nexus/Pixel smartphone or Android one device. Other interfaces such as ZenUI, Xperia UI, Samsung TouchWiz, EMUI, etc. offer a nicer ability to align more options with styles of applications that users think are kinder. However, OEMs' smartphones come with bloatware and certain apps that you probably won't use. So, we recommend that you try the handset before choosing one.811 A large part of the smartphone is taken away from the OS and the device is preinst installed on the application. 16GB/32GB/64GB or more does not come with the exact space mentioned. To reduce the number of apps on your device, you can use 32 GB of storage. Users who want to keep a larger number of apps will go to a 64GB or 128GB variant. You can also buy microSD cards as well as supported 16GB models.911Yom most smartphones have started using additional security features such as fingerprint sensors or iris sensors. This is not a password to access a specific file, document, or app, rather than locking or unlocking the handset. Fingerprint sensors can also be found on Rs 5,000 smartphones, but few devices still have iris scanners. Since most of us have personal information on our terminals these days, it is better to buy a smartphone with these additional security features. 1011 The quality of the audio with the picker can be an important parameter for those who rely on heavy video streaming or video conferences. If you like entertainment on the go, buy a handset with front speakers. This provides clear sound even while holding your smartphone in landscape mode. If you don't get into video streaming or video conferencing much, a regular handset with a floor-firing speaker is fine. Users with speakers on the back are fine.1111Ports can also be a factor to consider. Nowadays, you can use both micro USB and USB Type-C ports on your smart phone, but it is desirable to switch to USB Type-C. A greater number of smartphones are now incorporating new standards. Few people have even started throwing away the 3.5mm headphone jack, but there could be a good two years before all OEMs switch completely to usb Type-C based headphone jacks. Reprint permissions: Times syndication service Android Wear is a useful tool for checking notifications and getting quick information without actually pulling out your phone. However, if the battery of the watch is dead, it will be useless. Here's how to determine the cause of battery drain: Related: How to set up, adjust, and use your Android Wear app on your phone. Once you are there, tap that little cog icon in the upper right corner. This menu is a bit misleading because it doesn't really look like a top option. But it does, tap it. It is a place where you can control various parts of the general use of the watch, such as screens and cards. But we are looking for one of the lower options: battery view. Tabs. It will take a few seconds to load (maybe a little longer) because the phone actually needs to get data from your watch. But when it's all over, you'll look very familiar with it because it uses the same interface as your Android's battery settings. The main difference here is that you can't tap each item to get more information or interact with it. This screen will literally consume battery and nothing more will tell you. But that's really what you need here. When you know exactly what's going on, you can adjust accordingly. If your current watch face is chewing through the battery, just swap it out for something a little cleaner. If it's an app, you can be forced to uninstall it or theoretically close the app in android's settings to even have to kill it on your watch. Watch.
