Support nintendo 51330

The Nintendo Wii displays these 50299, 51030, 51331, 51332, 52030, 52130 network-related error codes that Nintendo Wii users see when their game console cannot connect to the Internet. An error message is added to the following error codes, such as: Unable to connect to the InternetEr code: 51330 Unable to connect to the Internet. Confirm the internet settings of wii console/Error code 51330, for example, there is a specific network-related error code for Nintendo Wii indicates that the authentication process between the console and the wireless router or Internet access point it is connected to failed, so the console cannot connect to the Internet. In most cases, the main cause of this problem is the router or access point that denied Internet access to the console because the console's Internet settings configured an incorrect access point security key or security type. In several cases, this issue may also be caused by another issue caused by the end of the access point or wireless interference in all things. No error code 51330, however, the Nintendo Wii has a ton of other network-related errors that have almost the same causes as error code 51330, and the following solutions can be used to correct these error codes:Error Code 50299 - Will break your ugly head when your console cannot connect to the online service or feature because the settings of the access point that the console is trying to use have not been configured. Error Code 51030 - Can be seen when there is no wireless network that is in the console range is configured into it or compatible with it and the console tries to do everything that requires an Internet connection. Error codes 51331 and 51332 - Basically have the same triggers as error code 51330.Error code 52030 - Indicates that the password for the wireless network to which the console is currently connected is incorrect. This means that the password may have been changed or configured incorrectly in the console. Error Code 52130 - Visible when the Wii console fails the Internet connection test. Fortunately, for anyone affected by error code 51330, there is an approximate idea about the cause of the problem and how the problem can be solved. Moreover, since other Wii network errors, such as those listed above, have many of the same possible causes as error code 51330, they also have common solutions. Therefore, any solution you can use to get rid of error code 51330 can also be used to test and get rid of any of the other network-related error codes on the Nintendo Wii. The following are the most effective solutions that anyone affected by error code 51330 can use to try to get rid of this problem (as well as many other network-related issues on the Wii) and Internet access on your Wii console: Solution 1: Power cycle for your routerOne of the most common causes of Internet connection problems when trying to access the Internet via wireless access point is some sort of problem with the wireless router. In such cases, the router can be restored using a power bike, and what causes the problem is usually solved separately. Here's how to turn on the wireless router cycle: Turn off your router. Disconnect the router from the power socket. Wait 90-120 seconds for the router to be running successfully. Reconnect the router to the power socket. Turn on the router. Connect to an access point from the Wii to verify that the problem is resolved. Solution 2: Change the connection security type in the console If your Wii console is configured for an incorrect Internet connection security type, you may see error code 51330 each time you try to connect to the Internet through the console. In this scenario, simply change the connection security type back to WPA2-PSK (AES) to resolve the issue. To do this, you must:In the Wii menu, press the Wii button on the console remote control. Select the Wii Settings.In wii system settings menu, use a small arrow on the right side of the screen to go to the second page, and select Internet when you're there. Select Connection settings. Select the connection profile you're currently using, and then select Change settings. Use the small arrow on the right side of the screen to go to the second page, and then select Security type. Select WPA2-PSK (AES). Note: If the access point you are trying to connect to the Internet has a different security configuration, select that instead of WPA2-PSK (AES), which is the most common security configuration. In the box that appears, type the passpoint password, and then select OK. Select Save, and then select OK. The console will begin testing the connection using the newly configured security settings. Solution 3: Make sure that you are using the correct wireless network password One of the most common causes of error code 51330 is incorrect password for the wireless network that you are trying to access online configured in the Wii console. In this case, just make sure that the console uses the correct password to connect to the access point should get rid of the problem. To apply this solution, you'll need to access your Wii console's wireless network settings, select an access point, and make sure that you have entered the correct network password in the provided field. Be sure to check your connection to see if you now have internet access as soon as you have configured the correct password for your Wii console. Solution 4: Make sure your wireless router is using wireless mode, compatible with your Wii consoleNintendo Wii console supports only 802.11g and 802.11b wireless format, so if your wireless router uses another wireless mode (802.11n only, for example), you can run error code 51330 when you try to access the Internet through an access point. If it turns out that the culprit behind error code 51330 in your case is actually incompatible wireless mode, you are going to go to your wireless router settings (exact instructions that differ from the manufacturer, but can easily be found on the Internet or the user manual that came with the router) and change the wireless mode to one that is compatible with your Wii console. Once this is done, simply log in to the access point from your Wii console and make sure you can now successfully connect to the Internet. Applies to: Wii U Deluxe, Wii U Basic The information provided in this article can help you when you cannot connect the Wii U console online when you use online features from Wii Mode or when the system receives an error message Unable to connect to the Internet. This often happens because of an incompatible security type or a router's refusal to sign in because an incorrect security key or security type is entered in the Wii U Internet settings. This can also be caused by wireless interference. Before you continue troubleshooting, go to your home network, and then try the console's Internet connection again. If you receive a 7-digit error code from your Wii U during a connection test, look for that error code and follow the specific troubleshooting associated with that error code. Review your router's wireless security settings, paying attention to your wireless password and security type. When viewing wireless security, make sure you know correctly if the setting is WEP, WPA-PSK (TKIP), WPA-PSK (AES), or WPA2-PSK (AES). WPA2-PSK (TKIP) is Wii-U-compatible, but it is not supported in Wii mode. If your wireless router uses WPA2-PSK (TKIP), you must change this setting to use Wii Mode's online features. After you write down your wireless security info, open the Internet settings of the Wii U console and enter the wireless security type and password into your existing Internet connection. In some cases, your router can be set to WPA2 - PSK (AES + TKIP). In this case, select WPA2 - PSK (AES) over the Wii U internet settings. After you enter your password settings, you'll take a connection test on your Wii. If this succeeds, try using Wii Mode online functions again. If the trial connection fails, this may mean another setting within the Wii U console for Internet settings that are incorrect. Create a new Internet connection wii u, the same wireless password information used in the previous step. If the test connection continues to fail, review network setup and make changes that can improve wireless signal strength. After you've tried each of the recommended changes, use a recently created Internet connection to test your connection. If the problem persists, check the following settings for your router settings: MAC Filtering If enabled, MAC Filtering will block unauthorised devices from connecting to the network. If this option is disabled, no more changes are required. If this option is turned on, find your Wii U MAC address and enter it in the list of allowed devices. If the problem persists, please contact us for additional help. The information in this article can help when you cannot connect to the Internet and you receive error code 51330 through 51332. This error code indicates the authentication process between the Wii and the wireless router or access point failed. This is often caused by the router refusing to connect because an incorrect security key or security type has been entered into the Wii Internet settings. This can also be caused by wireless interference. Change the security type for your Wii system settings to WPA2-PSK (AES) and try your Internet connection again. If the Wii detected an incorrect security type during initial setup, simply updating this setting in an existing Internet connection may resolve the issue. If this setting has already been pre-selected as WPA2-PSK (AES), try the connection test again before proceeding with the next step. Check your network settings to make sure you're using the correct wireless password. Pay attention to both the wireless password and the security type. Both must be correctly entered into the Wii settings. Update your Wii internet settings security settings. Carefully review to ensure that the security type and password match the information in step 3. After you enter the correct password or key into your system, try signing in again. If the problem persists, continue troubleshooting. Start your router and modem, and then try again. In your router's settings, make sure that wireless mode is compatible with the Wii console. The Wii console supports 802.11g and 802.11b in wireless format (also marked as up to 54Mbps for some routers). If the router uses only 802.11n (Up to 300Mbps) mode, you will need to change this setting so that the Wii can connect to the home network. Change the router channel setting to 1 or 11. By default, most routers broadcast on channel 6, which coincides with other channels and may be weaker. Previous steps solve most of the issues that cause this error code; however, if you still can't connect an additional Internet connection troubleshooter. Alternatively, if and would like to work with a member of our support team, please contact us for help. Support.
