Ontario rat 3

(2 Reviews) Write availability review: Available to order RAT Ontario 3 is a Jeff Randall collaboration as with all RAT fixed blade knives, it features excellent quality. The smallest of rat fixed blade knives, rat 3 knife has a 3.9 blade and is 7.9" which makes it the most suitable for a permanent blade and everyday carrying. Rat Knife 3 is also the only one of rat fixed blade knives to be offered with a jagged tip. RAT 3 has a tanned micra handle and comes with a MOLLE-compatible nylon sheath. Ontario RAT 3 fixed blade knife manufactured in the U.S. Total Length 7.9 (20.1 cm) Rigidity 57-59 HRC Edge Type Standard Edge Type or Jagged Color Tan Blade Grind Full Flat Grinding Blade Color Thickness Black Blade 0.125 Inch (0.318 cm) Blade Material 1095 Length Steel Blade Carbonate 3.9 Inch (0.318 cm) Blade Material 9.8 cm) Micarta Material Handle Sheath Material Nylon Sheath Color Black Sheath Type MOLLE Matching Note: Ontario RAT 3 Knife Used OKC Model Number 8630 and 8632 (2 reviews) Write review 4 posted by Kieran on July 2720 at an affordable price and high quality, only the side down is that cumbersome sheath for such a small knife. 5 posted by Nathan on May 13, 2020 The Perfect Rat 3. It's small enough to EDC, unsected, and really looks like it can handle some rough use for its size. I've wanted one for years. I'm glad I finally pushed the trigger and woke up. MSRP: \$94.95 Our price: \$73.25 online just item #BHQ-75456 Brand:Ontario Knife Company View all specifications Description specifications Reviews This RAT-3 model features a black coated blade with a normal edge and a tanned micarta handle. RAT-3 Ontario is an excellent outer knife that will stand the test of time. This RAT-3 model is equipped with a carbon steel blade 1095 that has been coated with a durable black finish. The Micarta fabric handle is thin, but fills the palm and provides sufficient texture for a secure grip. The item includes a heavy nylon belt sheath with MOLLE compatibility. Read more Show less brand:Ontario Knife Company Page 2Page 3Page 4 Anyone who's ever drooling over an Esee knife just to get their heart broken by the three-figure price tag may appreciate the third rat for what it is: a cheaper, same cousin of Esee Design 3. Remotely they look the same, except perhaps an inch size difference and the lifetime warranty offered by Esee. After testing the rat, though, I'm pretty sure the price difference signals a big difference in quality that you just have to feel. Before I get too critical, Rat III is a good knife, but it suffers from being part of a very large family of bushcraft and survival knives. And if Jeff Randall is the grandfather of the extended family, he puts most of his pitying attention into making the best easy knives they can be, while the rats are stuck in a mass-producing maze of Ontario knife factories. That doesn't mean Rat III doesn't have some impressive qualities. I enjoyed it, and it certainly convinced me that Micarta was definitely the way to go with survival knives. He only has some performance issues that I suspect have been marring by rowan production. Specifications Total Length: 7.6 Blade Length: 3.6 Handle Length: 4.0 Steel Blade: 1095 Blade Grind: Flat Blade Style: Drop Point Handle Material: Knife Weight Micarta: 4.9 oz Sheath Weight: 2.5 oz Sheath: Ni Curtain Made: USA Price Range: \$60 – 70 Hard Steel Pros with Good Factory Edge Keeping Good Edge Comfortable Light Bearing Handle with MOLLE Nylon Sheath Cons Don't Ignite Well on Ferro Sub-Par Rod on Trim and Feathers Check Price on Blade HQ Check Price on Amazon Blade I Don't Know what you usually expect in Blade Survival 1095, but I expect it to be sharp, and for this level of sharpness to stick around for a while. The third rat surprised me a little bit here. It performed pretty well on a paper test. It took a few starts, but I got quite a few clean cuts through some standard printer paper even after chopping with it. So the grinding and steel temperament of this blade is well made. Which means the complaints I'm about to file about the third rat may be caused by some deliberate design choices, but I'm going to complain anyway. Check price on blade HQ check price on Amazon on trim this thing is pain chop with. It doesn't bite into a hard tree any better, and the handle starts to slide after a few hard swings. I probably spent close to ten minutes cutting back on the branch without going very far. Yes, the branch was a little too big for a knife that size, but I didn't even do it in the middle before I decided to just call it. If you want to chop something thicker than maybe an inch and a half you'll probably be better off as a gods. Check price on blade HQ check price on Amazon on Feathersticking also grinding also doesn't seem to take the sticky leathers too well. I tried both the manzanita and what I'm pretty sure was a stray birch stick, and rat 3 had trouble biting both of them to make nice long chips. I have some leftover wood from it, but nothing very similar to a decent feather stick. On Pro Rod honestly, it may not matter that much, since it doesn't throw sparks from a ferro rod very well anyway. It takes a lot of effort to see something light, and the sparks aren't big enough to travel far at all. The spine looks sharp enough to work well in this area, so I don't know if it's the finish, or if I just don't have the skill for that kind of thing. I know when I run the Black Selkirk on the same pole, making sparks is effortless. But more on that comparison later. End The best I can say about this blade is that it's hard as hell, and it will hold an edge. It can stand a little caressing before you take it though. Check price on HQ blade check price on Amazon handle and ergonomics I really like this handle. It's a healthy next step in my burgeoning love of karate. My only problem is I'd like it to be a little more edgy, or the scales were a little wider, because it was trying pretty hard to slip out of my hand when I was assigned. Besides, the ergonomics of the knife is great overall: Tang is perfectly flush with the scales so there are no hot spots. It's not in a way moreover, so there are a lot of different ways you can comfortably hold it (though I can't imagine what you'd like to do with this thing in an ice pick grip). The mikorte is soft and mostly fascinating, and mediation feels almost right to prevent a thumb from slipping without feeling too aggressive. And the height of the blade detracts from the amount of control you get in total, but it's a small detail. For a simple knife, there's obviously a lot of small production details in it that feel like they've hit the Goldilocks area. The Moccarta does stain pretty quickly. There was almost no lag between me and taking it out of the box and the scales looking a little rubbed from my filthy arm's-mouths. But I don't see it as a problem. This knife was made to get dirty, and the stains play into her rustic aesthetic. The sheath I love this sheath more than most people I've dealt with. It's really comfortable carrying vertically and scouting. The horizontal carrying straps are a bit of a pain to get on a thick leather belt, but it has a big weight distribution once it's on. The button straps that cross the handle are mostly nice, but they're not necessary to keep the knife secure. If you want to keep the knife in a slightly faster approach, it will sit fine with one buttoned strap. It would be fine for a clearance with no buttoned strap if you go for a clean path. I didn't notice a hill jump walking shaking the knife much, but it didn't go down with a little smoothie test at home, so I wouldn't risk it for too long. OKC makes a Kydex sheath sold with Luke Tech for Rat III. I didn't try it, but my past experience with that kind of setting showed it wouldn't feel so balanced as a heavy-strap nylon sheath. It's a good way to make it a adjustable carry. And if you have a really big belt, Luke Tech is probably the only way you're going to carry this thing horizontally. Check price on HQ Blade check price on Amazon comparison and alternatives I've voted for Esee 3. These two are very similar in style because they were both designed by Jeff Randall. Ontario Cumani manufactures all the rat designs under a licensing deal that I believe was made shortly after Jeff Randall left the Ontario Knife Company to start Esee Knives with Mike Perrin. I haven't handled the Esee 3, but I know Essie offers a lifetime warranty with no questions asked about all their knives, and I've heard the fitness, finishing and overall quality control much better at the smaller Idaho factory that Essie uses for most of their knives. If the edge of Esee 3 performs at all better than Rat III I would say the extra price is definitely worth it. If you are on a strict budget sub\$100, I also heard that Ka Bar Campanian BK2 is a good alternative. I haven't handled that knife (yet), but its reputation certainly makes it worth considering before you pull the trigger on Rat or Esee. As far as the knives I've dealt with personally, the Bradford Guardian 3 and Buck Selkirk seem like good alternatives. At least, these are the knives we got to bring when we tested the third rat. Rat III compared to Bradford Guardian 3 Guardian 3 win the third rat in almost every category: tackle ergos, carving, feathers, and even chopping were all the easier with the Bradford knife. If you're just going by price, you should expect the guard to do better, but if you go by size and shape, it really looks like the third rat needs to put up a better fight. Surprisingly, The Keeper 3 is a bit thicker in the spine, but to me it looks like it angles down to be thinner behind the edge, so you get a much more extreme wedge shape from the Guardian than you get from the third rat. This could explain the difference in cutting and cutting ability. The best feature Rat III has on the Guard is toughness. The wide blade and drop point shape should make the edge much safer, and I would expect the edge in general to hold more abuse before it breaks. We ran both knives through pretty rough use, and neither broke, by the way. I can probably draw some helpful conclusions about the difference between rat's steel 1095 and the Guardian's Bohler N690 steel. I'm just saying they both survived my abuse like champions, but I'd be much more comfortable punching Brett III, and abusing her in general, than in Guardian 3. Check price on HQ blade check price on Amazon rat III compared to Buck Selkirk Buck Selkirk is a much more price comparison even, and frankly I have yet to check a fixed blade knife in this size range that I can recommend the Selkirk with a clear conscience. It cuts better, it throws big sparks with little effort, it has Buck's 420HC, and it comes out a little cheaper. The only thing the third rat has solidly on the Selkirk is the twerling handle and the mikaert. The handle of the Selkirk has good shape, but the material is cheap and slippery. I'm also... Really want to chop with the Selkirk. The tip bites well, but I think Chinese manufacturing makes the knife a little weaker overall, so I'll just be more hesitant about really tough tasks overall compared to the third rat. The conclusion at the end of the day, the question is whether this knife is worth your money. I had to say yes, but barely. You can usually expect to pay around \$70 for Rat III, and I think that's fair considering what you get. OKC does some solid production here in the U.S., and as long as you give this knife the strongest attention, it can last long enough to hand over your kids, and deliver close to the same performance as when you have it. I like it. But like a survival knife it really feels like it should be performing a little better when there are so many other great options available in this category.
