How to win a iphone 6 battery

Tom's Guide has just posted its iPhone 11 battery test results to determine which of Apple's new flagship smartphones will last the longest. When Apple announced the new iPhone 11, one of the most exciting updates was the increase in battery life. Apple's own website aims to have the iPhone 11 Pro and Pro Max offering an increase of 4 and 5 hours respectively on the previous iPhone XS. Of course, the Max/Plus version of the Apple iPhone has always led the pack when it comes to iPhone battery life because of its much larger shape factor. With that in mind, Tom's Guide test pits all 3 new iPhones against each other. The phones were each made 150 nits of brightness, and then to continuously surf the internet over 4G LTE on T-Mobile (no doubt looking for Untitled Goose Game memes) As expected, the iPhone 11 Pro Max was the clear winner. The battery averaged 11 hours and 54 minutes (galaxy note 10 Plus scored 11:09 in a similar test). In second place was the iPhone 11, which lasted 11:16. This is probably due to the efficiency of the iPhone 11's LCD screen. Even though the Pro 11 has a larger battery than the iPhone 11 (3046mAh vs. 3190 mAh), it just managed to get an average of 10:24, a significant improvement compared to both 11 and Pro Max. If your iPhone 5 starts to experience significantly reduced battery life but aren't ready to upgrade yet, you can always try DIY repairs. Not only is it easy, but it's a whole lot more affordable than a new iPhone. Stay tuned and we will help you from start to finish! What you need for DIY to replace the battery of the iPhone 5 you need some tools and parts to repair your iPhone 5. They have quality parts, tools, and much more for all your repair needs. Spare battery iPhone 5 suction cup 5 point safety screwdriver Standard #000 Phillips screwdriver Spudger tool Razor blade iSamo Opening tool Step 1: Turn off your iPhone 5 Before starting repairs, always power your iPhone down completely using slide to power off option. Easy enough good? Step 2: Remove the front screen assembly To get started, use your safety screwdriver to remove the two screws at the bottom of your iPhone 5, located on both sides of the dock. Now place the suction cup over the Home button and gently pry up from the bottom. Take care to pull the entire screen off as the top of the screen is still connected with multiple cables. You just want to release the bottom part. When the screen is free, swing up the display assembly so you can get to the shield out there in the cable site. Using your #000 screwdriver to remove the three screws while holding the display shield down. Set the shield aside and remember not to misjudging the screws. Now use your spudger tool, three cables that attach the display to the board. After you have done this, the display must be free from the device. As a side note, you can see only two of the cables (as shown in the photo below), because the third is below. Most of the time the third simply plops itself when you remove the first two. You may need to release it, but most likely it will have to come up on its own. The second photo below shows its location on the board of reference. Set the device aside when the display is free. Alternative method: If you have trouble pulling the screen up with the suction cup, you can insert the razor blade on the outer edge of either screw hold and pry up slightly. This method gives you enough clearance to glue your spudger tool underneath and release the screen. I recommend this method, if your hands are not so stable or you are afraid, you can pull too hard and spoil the cable. Step 3: Replace the battery I preface in this section by saying plastic battery tabs to pull to release them are useless. They will break off or put the battery down. You can try this method, but I recommend following my instructions below the site. Start by removing the two screws shown in the photo below. This shield covers the battery connector itself. Use your own #000 screwdriver for this. Now use your spudger tool to gently pry the connector off the board as shown. We are now ready to remove the battery, which is the most difficult part, and this should be done with extreme caution to prevent it from

piercing or damage to the logical board. I use the iSesamo opening tool to remove the battery because it's pliable, which means it's more delicate. You can use the flat end of the spudger tool if you want, but I've found them to break off quite easily. To remove the battery, start from the upper left corner and insert the opening tool between the housing and the battery. Carefully start lifting up. You should hear the glue starting to crack. Now slowly move your gear around the left side of the battery and gently pry up a little time. Every time you should hear more glue cracking. Just apply the pressure evenly and move your pry tool every time. By the time you get to the bottom the glue should be almost free, or free enough for you to grab hold of the battery and carefully break the rest and remove it. It is important when performing the above steps that you are careful not to pierce or bend the battery. Just take your time and you get there. Don't rush and don't force it. Now you can insert the new battery. Pay attention to the connector cable, because you may have to bend it in shape slightly, if it is not already. Also remove any glue bases from the back of the battery. Connect the battery connector, gently apply it upwards and press firmly with your finger. Move protect the screen #000 to replace the two screws. Step 4: Add the add display assembly Reconnect three display cables back to your iPhone 5 board. Carefully place the display shield over the cables when you are sure they are safe. Replace the three screws you have removed previously using your #000 screwdriver. Sometimes the upper right screw is not magnetized and can be a little tricky to get back. I usually guide it with my finger and then use a screwdriver. Makes it easier to work. Now snap the display back down and in place. Be sure to lock the grooves at the top of the screen inside the frame. If you are facing resistance, do not push the display down. Make sure everything is aligned correctly and that the clips at the top are aligned correctly. Then try carefully pressing down again. Replace the two screws on both sides of the Lightning dock using a safety screwdriver. Step 5: Check the battery To check the battery, just hide your iPhone 5 and make sure it works. It's a good idea to charge it all the way and make sure the battery holds a full charge and doesn't deplete too quickly, which could be a sign of a faulty replacement. Also make sure your iPhone 5 doesn't get warmer than it should while charging, another signal for a faulty battery. If everything went as planned, you should be on the agenda again! Despite being powered by a 5G and OLED display, the iPhone 12 battery can benefit from efficiency savings thanks to the new A14 processor, as well as features such as Apple's Smart Data mode, which automatically switch between 4G and 5G to help better manage the phone's battery life. As the application notes, the Apple iPhone 12 mini has a significantly smaller battery due to its smaller shape factor, as the name suggests. There is no model to directly compare the iPhone 12 mini, however Apple notes that the iPhone 12 mini can start 15 hours of video playback, 10 hours of streamed video playback, and 50 hours of audio playback. By comparison, it's higher either way than the iPhone SE released back in April, but this phone has only an 1,821 mAh battery.
