Math Games and Activities from Around the World , Chicago Review Press, 1998.The University of Chicago. About everyday mathematics. when I turned it over and saw the word mathematics, I immediately lost interest. Why would I want to play a math game? I'm a writer. Where are my crossword puzzles, my word searches, my anagrams? Where are my letters? I threw the game that someone had sent me on the kitchen counter, thinking I would find someone to give it to later. It's a wonder I can add to all. I don't hate math, really. I was pretty good at school, so much so that I actually scored higher on mathematics than in the verbal section of the SAT. But my husband, who saw my face contorting and sweating as I struggle to teach my student about how to put thousandths in fractions, says I shouldn't admit it. Hey, I wonder how many words in the English language start and end with e like that! I happily offered my 10-year-old last night when he asked me for help with his math homework. He sighed, and went instead to find help for his father. I'm a words. But later, when I searched for the math game, intimidating titled Personal Trainer: Math, it was gone. Then I heard video game music that didn't look like Mario Kart (for once) coming from the other room. My son had loaded the math trainer onto his handheld game console, and was already running for his best score. I asked him to show me what he was doing. Okay, I've done the daily test, he said, so I'm going to do it. He clicked on something called the Kageyama method, which instantly made my eyes glaze over. I'm going to do the multiplication, he says, and I broke out of it and tried to focus on what he was doing. Soon, he quickly wrote answers to problems of random multiplication and undoeed his score. When he finished, he asked, Would you like to try? Multiplication tables? No, no, no, no, no, no, no, no, no, no But I thought I should try it so I could understand why my child loved this math game. I grabbed the console and started writing answers to problems such as 9 x 7 and 8 x 8 as fast as possible. When I finished, the game told me I was in third place. I think I had a nightmare like that in elementary school. I let him gloat, and I gave him back the game. He walks away, walking and writing mathematical answers at the same time. I can barely do it sitting down. And apparently, I'm not alone. A new survey of 400 children aged 9 to 14 found that many children believe that math is the most difficult subject in school. In fact, about 1 in 5 children believe they are more likely to grow up to become a famous athlete, actress or singer than to get A and B in mathematics. Worse still, many think they won't even need mathematics when they grow up. Ah, but they will, and not just when they check their kids' math homework. Of the 400 parents surveyed, 86% said that mathematics is important for their careers, even though more than half had previously thought they would never use the math they had learned in school. I brought some with my other son, the one who prefers to choose music and art rather than multiplication tables. That's what calculators are for! I tried to explain why you need to understand the basics behind the math problems to even use a calculator in the first place. Then I told him about the study, and how 1 in 5 adults had also thought they would be more likely to end up famous than to use mathematics as adults. But you're famous ... sort of, he replied. And when do you use mathematics? You're an author. To add up my royalty cheques, I replied, and soon he was arguing. My fourth grader recharges his Nintendo DS so he can play more math games later. Key I always prefer crossword puzzles, but I think I'll try to face beating his Kageyama - or whatever - score tonight. You don't have to like mathematics to want to be number one.
