Citra fire emblem awakening stutter

Edit Comments Share The official Citra compatibility list can be found here Currently there are four real Nintendo 3DS Emulators: Citra, 3dmoo, TronDS and XDS. These are real emulators; However, the emulering are nowhere near perfect, as there are still some elements yet to be emulated that some games exploit or require, and the hardware on it is still not fully understood. Therefore, some commercial games are playable on Citra, XDS, and 3dmoo (from now on, TronDS and can only play homebrew games), but some are extremely laggy (virtually unplayable) and some games don't start at all. But some commercial games, (even great titles like Kirby Triple Deluxe) are fully playable, with no problems at all at 60 FPS. The list of 3DS games is below. Please note that even if the games are on this page, they may not have been fully tested yet. Some games will of course perform better and more games will become playable as more and more updates come through, so the list is constantly updating and changing. Keep checking back if your game isn't working, is slow, or not tested. Rating[edit | edit source] - 5 stars: Plays perfectly, no downs, possible minor sounds or graphic glitches but nothing noticeable. - 4 stars: Playable, with minor sound glitches, graphic glitches, or both. - 3 stars: In the game, can play well but with some bad graphical issues or sound problems, or both. It can also crash frequently. - 2 stars: Menu / intro, can see the intro to the game and possibly the title screen, but no longer. The game will crash while loading or at the title screen. - 1 Star: Unplayable: Game that does not start at all or start up to a black screen. - Untested: Untested - not tested yet, may or may not be playable. 3DS[edit | edit source] Community content is available under CC-BY-SA unless otherwise noted. Question: I've been playing on citra for about a year now specifically the fire emblem game and I have about 70% on everything, and I used a laptop with an I5 and on my new desktop that I've used the fire emblem destinan scans game goes down to 2-20% on my new computer and would like some help. System Information Operating System: Windows 10 CPU: Radeon RX 570 Series GPU: AMD Ryzen 5 2600 six processor core Citra Version (available in title bar): Citra Nightly 1420 Game: Fire emblem fates special edition In order for us to provide better support, we need to see the log generated by Citra. This guide will walk you through how you can obtain the log file. Support System InformationClient Version Nightly 1420 HEAD-4991c01 OpenGL Vendor Null OpenGL Renderer Null OpenGL Version Null Enable Hardware Renderer [x] Enable Hardware Shader [x] Hardware Shader, Accurate Multiplication [x] Hardware Shader, Geometry Shaders Null Enable Shader JIT [] Enable Vsync System Region -1 I did not find any error in your log file. Are you kind? for a moderator to assist. Does the game run better at native 240p? Unfortunately AMD GPU as RX 570 does not work well with OpenGL applications on Windows, you can try dual boot Ubuntu(Linux) to access the open source Mesa drivers that would increase performance significantly. The second option is to switch to Nvidia, like the GTX 1650 Super (it's important that you get the Super version) which has good cost per frame similar to the RX 580. That's around \$160 new. If you're a hardcore Fire Emblem you'd probably want to turn off combat animations so that should help speed things up home Categories FAQ/Terms of Use Privacy Policy Hello guys, I'm deeply sorry if I shouldn't be doing a topic like this, but I've been looking over the internet for months and still can't play Fire Fate (and they had shadow of valentia). I've tried every single emulation that I can find in the net, and later builds seem to make the game smoother, especially anime cutscenes. But when I go into a battle, the game LAG set. FPS dropped badly. Everything else is good, really good. I swear to God I've heard that Hhhhheeeerrrrreet... liiii... iiiii goooooo--- too many times as I thought, it was a hundred! Should I need the config emulator somehow or, should I make any adjustment to my system? Please help me, thank you very much! System Information Operating System: Windows 10 Pro 64 bit CPU: Intel® Core™ i7-6700HQ CPU @ 2.60GHz (8 CPUs) GPU: NVIDIA GeForce GTX 960M Citra Version (available in title bar): Has tried everything Game: Fire Emblem Fate - Special Edition Log: [47.539629] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 Probably uses a lot of texture copy as in Awakening. I guess you can play without combat animations until Citra has improved that part. The log does not matter and a row is not the entire log. Citra is currently in very early stages of development. Games tend to run less than full speed even on the best PCs. Expect bugs and glitches to appear in most games. Many features for a more stable emulation are still in the works. For any major updates, please visit our Website. I understand that Citra is in its innovative way of completing. Still, I found videos here and there, playing the game so smoothly. I've also tried emulation they used, but there's no point even though I have a better hardware (the only push-back was that I use a laptop). I'm thinking that the emulator didn't use my NVIDIA GeForce GTX960m and instead, used the HD Graphic 530 extension. I've been thinking this might be the question, but still, I don't really know how to change this. Sure, I've tried the NVIDIA control panel as well. And for the entire log: [0.000000] Common.Filesystem commonfile_util.cpp:FileUtil::IsDirectory:122: state failed on The system cannot find the specified file. [0.004924] Common.Filesystem commonfile_util.cpp:FileUtil::CreateFullPath:200: path exists C:\Users\hayam\AppData\Roaming\Citra\config\qt-config.ini [10.642954] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [10.644427] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [23.271817] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [23.272835] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [23.396720] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [23.396720] HW. GPU video_core\renderer_opengl\gl_shader_gen.cpp:GLShader::AppendSource:64: Unmanaged texture type 1 [23.396720] HW. GPU because you probably edited the logging options in .ini so it would only show the critical entries. Try turning off Exact Hardware Shader. I did that and it runs smoothly with my ryzen 3 1300x and nvidia1030 combo. You can also try to increase your gpu it also increases performance. Do not answer old topics. This thread was made before all hardware shader updates. If you have a question yourself, please make a new thread. Home Categories FAQ/ Guidelines Terms of Service Privacy Policy Home General Forums General Start Fire Emblem on Citra Emulator Home General Forums General Start Fire Emblem on Citra Emulator You cannot perform that action at this time. You signed in with a different tab or window. Reload to update your session. You logged out in another tab or window. Reload to update your session. - Wow... Can't wait to try this. - Great job team to test Fire Awakening game! - Video update: - Please do not release this emulator until 3ds are no longer made., and the system ends up being produced as the snes gameboy advance and regular nintendo ds... I m all for emulation but I strongly believe this emulator would hurt developers in the long run and good games like this game would not be possible to exist with some sorta income from the fans. Does the emulator developer really want to handle such a blow to up and coming games of a system that is still going strong and with massive base of users?? Fire emblem is a still selling new for \$39.99 msrp..come on guys this is borderline discussion in no time we'll see persona q or super smash bros 3ds supported - you know, if they actually upgraded the console with better graphics instead of releasing the same thing again, I would have been more empathetic. Nintendo has received one of the money from 3DS. White on the other is something I'm willing to sob history with. - Does Has Played Monster 4 Ultimate? That and xenoblade have the graphics you're talking about. I'm sure up the upcoming dragon quest that is released for ps4 nx and 3ds will take advantage of the new 3ds XL... after playing both I can tell Nintendo knows how to make a handheld you're right about Sony but I wish more games would be put on white because it's a powerful handheld but that's for another discussion. The pppssp emulator team that did it they have some damn good skills. Hats off to them - Remember when GBA flopped harder than Virtual Boy because of VBA. They only 377 million games for that matter what a failure I'll tell the Citra guys they best pack it in. - so Pokemon XY is playable but slow and glitchy now. Still no solution to sound (if it ever will be) - Finally! Pokemon games are now running on Citra!!! I hope will improve the speed and then make sound on it soon! Soon!
