## Retumbo reloading data

This magnum, extruded powder was developed specifically for really large overbored cartridges such as 7mm Remington Ultra Magnum, 300 Remington Ultra Magnum, 30-378 Weatherby Magnum, etc. Retumbo added 40-100 fps at higher speeds to these cartridges compared to other normal Magnum powders. In addition, it is Extreme Powder, making it ideal for great game hunting in all conditions. Available in 1 lb. and 8 lb containers. EXTREME RIFLE POWDER REVIEW - Cartridge (Required) - - Bullet Weight - - Gauge (Required) - - Shell (Required) - - Load Type - - Shot Weight - Case: Twist: Primer: Barrel Length: Trim Length: Thanks for sharing Hodgdon handling data. Home/Tag Archives: Hodgdon Retumbo These are some of my pet loads. These were what I found to be the most correct in my guns after extensive and exhausting loads of development. I might tweak the load a little as the throat barrel erodes, but I don't usually differ too far from what is shown here. You should always refer to the quality handling manual and start with the minimum recommended loads and work your way up. Just because they have proven safe in my guns doesn't mean they'll be your's. Camera sizes, brass specifications, barrel grooves and diameter may vary, so it's very important... Read more » After I set a promising range of powder weights using Audetter's ladder test, my next step was to use Dan Newberry's Optimal Charge Weight (OCW) method to compensate for the lack of a scattering knot inherently present in the stairtest. To learn more about it, read this article comparing the OCW method with the stairs test. The OCW method is based on an observation that there are some loads out there (such as federal game ammo for 308) that shoot really well from just about any rifle. How can one recipe shoot so well from so many different guns? Dan Newberry believes in accuracy... Guys, I need some load data for 300 RUM using Retumbo with 200gr Accubond. I just got home from a bow hunt up to the public PA (no luck passed up to 3 small bucks) where I found I made a big little gun shop with tons of handling stuff. I couldn't find retumbo anyware around here. This guy had every powder you could think of... almost. Good prices too. bad he's 270 miles away. But the exact load is what I'm looking for. The firearm is Rem Sendero with a 26'in tube. Thanks for the help above. start around 88.0gr and work up. I got to 89.0 and 90.0gr in the 216clinch river with super results. I have great results with 94 Retumbo. BTW, I moly my 200 gr Accubonds though. If you can not find Retumbo, 95 gr RL-25 RL-25 even better than me. Ronnie Retumbo; Due to 95.5 grs from Retumbo behind 200gr NoslerAccubond on a solid 3200FPS. I killed my first California Black bear, last Sunday late afternoon in the Klamath National Forest.I went with guidsthat used hounds. It was awsome, never hiked so hard in such a rugged wilderness in my life. Chasing after dogs after they bark bark that say they have a treed bear. The Bear I shot in the 300RUM was about 100yds,100 feet up to the big \*\*\* tree. The first shot shook both of his shoulders, secound I think broke his back, the guide said fire again and I aimed it back again, and he went flibing the end to the forest rocky creek at the bottom of a huge canyon we had to hike down. As soon as I figure out how to put pixs, I'll do so. The bear was about 200+ lbs. Felt I could have done the same thing with 30-04 or even 308, too much gun, but it was so much fun. I have been using Retumbo powder and Accubond 160 grains in my 30-378 wetherby and have had great success. I now have a request for all that is loading data on 7mm using Retumbo with Accubond 140 grain. Do I need to know how much grain of Retumbo powder to use? My max load S & amp; The W M1500 7 RM had 72 gr pushing 160 AB's @ about 3,100 fps out of 24 barrels, and that was a full thing. Fed 215's .010 at the lands. By 140's you could have a compressed load before you reach the max. Start low and work up. Up.
