Learn more View More View More by Seifeddine Abdullah Data Communications between digital devices often done through serial cables, which are used to transfer data between bit-bit devices or serial port communication technologies. Most types of serial cables use the rs-232 standard interface (recommended Standard-232), which mainly determines that data must be sent in a predetermined sequence of bits. In general, serial cables are classified according to their interfaces and standards. This serial cable is commonly used between DTE and DCE-ie, data station devices and data communication equipment respectively. In communication terms, DTE refers to the end/start of the session point, and DCE means the call session forwarding point. These cables offer both 9-25 and 25-25 pin links in end-of-transmission and receipt links. DTE-DCE cables are usually used to establish a connection between computers and modem cards. In this scenario, a computer works as DTE stacks and a modem card as A DCE. The Lagi modem is the ideal standard cable to connect two computers using an empty modem configuration. It is called null-modem because it includes no DCE (modem) between DTE-DTE sessions. Furthermore, this process uses a certain signal amount to ensure the stability of communication between two devices, known as handshakes. An empty modem broker is configured by a serial cable connected to an empty modem adapter, after sending and receiving lines across the link. The most common empty modem cables have 9-9, 9-25 and 25-25 pin in their connectors. This cable is almost identical to the basic DTE-DCE cable, but there is no handshake between the computer and the modem. This cable is also available in 9-25 and 25-25 pin configurations, similar to the DTE-DCE core. A constraint from a non-handshake procedure is the lack of notification from the End of DTE. The V.35 link interface is used to connect the DTE-DTE DTE DCE-DCE nodes. It also provides an improved data rate of up to 64 kbps, by providing 34-34 pin configurations in both terminal transmitters and receivers. This broker is a mixture of RS-232 and RS-449 standards. The areas left behind in the standard areas include RS-232, RS-449 V.28 and V.11, respectively. Serial printer cables are used to establish a connection between the computer and the printer through a sequential port. This cable is a specific configuration; That is, a 9-25 pin cable is used when both the printer and the computer work as The DTE and the 25-25 pin cable is used when the computer and the printer acts as DTE and DCE, respectively. When both devices have DTE, an empty modem cable can work; However, if a serial printer is connected to a computer through it, it is Windows doesn't display your computer's serial number anywhere in its interface, and doesn't do common system information tools. But you can often find the serial number of your computer with a simple command, a peek at your bios, or on the devices themselves. WMIC triggers the command to open the command prompt window to begin. On Windows 10 or 8, right-click the Start button and select The Command Prompt. On Windows 7, press Windows + R, type cmd in the running dialog box, press Enter. in the command prompt, type the next command and then press Enter: wmic BIOS get serial number you'll see the serial computer number displayed below serialnumber text. This command uses the Windows Management Command Command Line (WMIC) tool to pull the system serial number from its BIOS. If you don't see your PC serial number, you should blame the computer manufacturer. The number will only appear here if the computer manufacturer saves it in the computer's BIOS or UEFI firmware. Computer manufacturers do not always fill the number correctly. In this case, you'll see something like 0 or should be filled by O.E.M. instead of an actual serial number. Related: How to check the motherboard model number on your Windows computer and that's also true if you built your computer because the computer itself will not have a serial number. However, you can search for the motherboard serial number and other components. Check with BIOS and you may also be able to find the serial number in the BIOS or UEFI firmware settings screen. This technique will not get a serial number if it is not wmic command, because the command pulls the serial number from the BIOS. However, bios verification can be useful if you can't sign in to Windows to run the wmic command. Related: What does computer BIOS do, and when should I use it? Access the BIOS or UEFI screen firmware settings and look around for serial number somewhere on the system information screen. It will be in a different place on different computers, but you can usually find it somewhere on the Main or System screen. Find the serial number on your computer, box, or anywhere else if you don't see a serial number after you turn on a wmic command — or if you can't turn on your computer or you don't have access to it — there are many other places where you might find the serial number: If you have a laptop, flip it. On some laptops, you'll see the number on the sticker. On others, you'll see the number printed directly on the metal or plastic laptop made of. If your laptop has a removable battery, the serial number is sometimes on a sticker inside the battery compartment, under the battery. If you have a desktop computer, look back, top, or side of the case to get some kind of label. The figure may also be on the sticker inside the bag, so you may have to open it. If you can't. Serial number on the computer itself, search online for specific instructions for your model. The manufacturer's website should tell you exactly where to look. If you register your computer with the manufacturer or received warranty service, the serial number must be included in the registration documents, warranty service receipt, or e-mail confirmation of the service. If you still have the original product box, it usually has a serial number printed on it often on the same label with a barcode. If you purchase your computer online or in the store, the serial number may be printed on the email receipt you received. If you can't find your serial number at all, don't lose hope. If you have proof of purchase, the manufacturer may still be able to help you with any service you need, and may even be able to know the serial number for you. The best Windows 10 Key Product Finder make it easy to find all Microsoft serial numbers. Product keys are one of the ways software developers protect their products against piracy. Unfortunately, it is easy to lose, which can be a real problem if you need to reinstall Windows or any other program of scratchif you have purchased a desktop computer or laptop with Windows 10 already installed, you will probably find the product key on the authenticity sticker on the issue or in the listed papers, but not if you have built your computer and installed the operating system yourself. Many other applications also require product keys if you reinstall them — including Microsoft Office — and if you lose the email you received when you first installed them, you may be in real trouble later. Product key finders only work for programs already installed, so download one and make a note for all your keys now, so you're already ready. (Credit photo: Belarc) Is a tool for collecting information about Windows, including devices, security updates, and product keys. Whenever you run Belarc Advisor, it automatically checks its database for software definitions - necessary to find keys to new programs. Next, it scans your system and displays the results in the HTML page in your default web browser. Scroll down to software licenses to find serial numbers, product keys for Windows, Office, and many other applications. Belarc Advisor offers a wealth of other information, including details of antivirus software, connected devices, and other devices on the same network. It also offers security measurement points, although this unfortunately is only available for Windows 7, Windows Vista and XP Pro.Belarc Advisor's scans are fast and offer far more information than just serial numbers, it's our favorite free product key finder. (Credit: Abelsoft) displays Microsoft product keys in a clear and searchable list there are two versions of Abelssoft MyKeyFinder: free and paid. You will find both Windows and Microsoft Office product keys but the plus edition (£8.90 - about US$10, AU $15) will also scan external hard drives and find Wi-Fi passwords. After MyKeyFinder has scan your computer's record the results are displayed in a clear list, ready to be copied to the clipboard with a single click. Unlike many product key finders, MyKeyFinder will not vomit duplicate keys and can search and filter the results. You can also add programs and keys that have not been detected by MyKeyFinder as standard, and then export the full list as PDF so that they are all in one convenient location. (Credit image: Klinsmann) Find windows keys and a wealth of other software softwareLicensCrawler will find the license key for any application that is pretty much that one, and it's free for home use. Scanning your Windows record takes a long time to complete — even if you select the high speed option — but you can limit its scope using blacklists and white filters. LicenseCrawler is distributed as a mobile app, which means you don't have to install it on the Windows system you're scanning - just download the mailfile, extract its contents, and run licenseCrawler .exe. This is especially useful if you have many computers. Just download it on a USB stick and you can just plug in and run it on any of them. The only downside to LicenseCrawler is the occasional pop-up ad, but finding the product keys is not a task you will do every day, so they are just a minor inconvenience. (Photo credit: RJL software) There is a quick way to find your Windows product key, but nothing elseWindows product key viewer is super-fast, with hardly a second to scan your system and deliver results. This is because, as the name suggests, it only provides the product key to your operating system. This should not put you in a hostile position although it does not find serial numbers for other applications, but it provides some additional information about your operating system, including the registered user, installation date and last run time, and is compatible with operating versions of Windows 10 all the way to Windows 95. Take care when you download the program - the site includes some ads that look like download buttons for the program, but actually have nothing to do with it. Just click the Download Windows Product Key Viewer link. (Credit Image: Network Software) A super simple way to find your Windows 10 Free PC product key check is another portable application, and don't even come as a zip archive - just download the X file and run it to start scanning. Like Belarc Consultant, Free Pc Provides a wealth of information about your whole system - not just its software - though the interface is not quite as intuitive. It's compatible with all versions of Windows, from NT all the way through Windows 10, but don't find keys for Microsoft Office or any other software. It also provides lists of all installed programs and running system processes, although this information is readily available through Windows itself. Same.
