Citristrip stripping gel coverage

How to use: 1. Protect hands with chemically resistant gloves and eyes with chemical splashes. 2. Shake well. Pour into a container and apply with a paintbrush. 3. After 30 minutes (up to 24 hours), scrape a small test area to see if the finish is ready for removal. For overnight stripping, after application, coating area for application with plastic until it is ready for scraping. Carefully scrape in the direction of a wood core with a plastic draining tool. For stubborn areas, use an abrasive sanded pad immersed in CITRISTRIP®. Toothbrush, toothpick or drain brush will help remove the old finish buried in recesses. 4. Use the paint to remove the paint to loosen the remainder of the residue, and then mineral spirits to prepare the surface for painting. The surface should be completely clean and dry before repainting. WARNING: CAUSES BURNS. Contains benzyl alcohol and surfactant. Do not mix with another product. Avoid eye contact and prolonged skin contact. Do not swallow. Contains a bitter agent to discourage accidental ingestion. If you are using indoors, open all windows and doors and maintain cross-ventilation of moving fresh air through the work area. FIRST AID - IF SWALLOWED, CALL the Poison Control Center (1-800-222-1222), hospital emergency room or doctor immediately for instructions. In case of EYE CONTACT is immediately washed with water, remove contact lenses; water for at least 15 minutes. If irritation persists, seek medical attention. Irritation may be obtained in contact with the skin. Wash immediately with soap and water. If irritation persists, seek medical attention. KEEP OUT OF THE REACH OF CHILDREN. Product Category: Max VOC Paint Removeer: Less than 50% Directions for Use are included to help you better understand our product. However, they do not provide you with all the information necessary for safe and efficient use of the product. Before using any of our products, you should always read the entire label, including all warnings. A copy of the current label is associated with this web page. Foreword: I had a great post all written about how to use Citristrip effectively, just as I've done in the past, but things often don't turn out exactly as you plan. After I wrote the post I went to shoot a video of the process and although I did the same process, I always did not do my job. What am I supposed to do? Scrap it and pretend it didn't happen? That's what I was thinking of doing until my brother dissuaded me from this and persuaded me to share the reality of using Citristrip, not what I hoped he would do. The products and that I show you in this blog work most of the time, but just like anything that can sometimes fail. Here's what I did! I'll show you how to get it right in the post below, but you definitely watch the video at the end to see how sometimes it doesn't work out and think about it. What happened: In the video Citristrip removed all the paint, but even after 2 applications it is completely useless against flaxseed oil primer under the 90-year-old paint. I've learned about me, and I hope you do. Now on guard! Paint removal paint is always one of my favorite themes, as there are so many ways to get the job done. Techniques and materials differ as much as accents in the country. In the end, you need to find the way it fits best for your situation. There are three main ways to remove the paint. If you are not sure where to start, I have written about each of the below posts, you should check first. If you know you're going to route chemical strippers then one of the best places to start is Citristrip. How to use Citristrip Here is skinny on Citristrip. I like to use chemical strippers to remove delicate profiles that would otherwise be difficult to work with. I can use my ProSraپر to needle flat pieces of wood in a flash, but it is almost useless when it comes to detailed work. Of the countless chemical paint strippers on the market today CitriStrip is one of my favorites for several reasons: It is biodegradable No neutralization necessary Non-raw fumes (pleasant citrus odor) Very effective Non-caustic (not methylene chloride!) Like all non-helmets chemical strippers, it doesn't work as fast as really dangerous things, so learning some tips on how to use CitriStrip effectively can make the process much easier. Citristrip can be used effectively to remove multiple layers of latex paint, oil base, varnish, enamel, polyurethane, shellac, acrylic and epoxy of wood, metal and masonry surfaces. Besides cured adhesives, there is very little that can not get away with CitriStrip. Getting started While CitriStrip is a much safer stripper, it's still a chemical that dissolves paint, so keeping it out of your skin and out of your eyes is important. Here are some basic precautions to take: Wear safety goggles Wear nitrile gloves NO latex, as this dissolves latex You have good ventilation (open all windows and use fans if possible) Wear a respirator with an organic vapour cartridge (especially if no proper ventilation is possible) Step 1 Apply a liberal CitriStrip needs a thick layer to work efficiently. Too thin and will dry and stop working. I usually apply a layer of stripper with a disposable brush 1/8 thick. The best way to judge that you have enough is if the surface is mostly the orange color of the stripper. If you see most of the paint or varnish below, then you will probably need to go a little thicker. Step 2 Cover with plastic (optional) if you have many coats then you may need to leave Citristrip longer and prevent premature drying that the coating coating with plastic can significantly extend the stripper's working hours. The saran shell, the paintman's plastic or something like that will work great. Step 3 Let's sit The length of time definitely depends on the number of layers of paint and the type of coating you are trying to undress. It can take from 30 minutes to 24 hours to dissolve the paint. You can make a test patch first to find the right time. Step 4 Scrape once the working hours are ready, you are ready to start scraping. You can use a disposable plastic knife or a simple scraper to clean the surface. For detailed profiles, the Hyde Contour scraper works great, or you can use anything else that fits the profile of the carpentry work in question. Another great option I use for very complex door profiles or mantles is a brass wire brush hand. It pulls the paint easily and meets the surface enough that you will not damage the profile. If you are trying to get the wood completely clean of all paint consider using steel in the removal process. You can use 00 or 000 steel wool dipped in CitriStrip to clean the old primer from the wood grain. Rub the steel wool and CitriStrip into the wood grain as wax application to a car and you will get the wood clean from almost all the paint residues, making it ready for varnished coating. Step 5 Cleaning Once you have most of the remainder, you will want to get the surface clean enough for paint and the best way to do it with some mineral spirits and steel wool. Use finer 000 or 0000 steel wool and mineral spirits to thoroughly scrub the surface and wipe it with a cotton rag. You should be ready for priming and painting! You can throw away the used stripper and the remnants of paint in the bin, just wrap it and put it in an ordinary garbage bag. If CitriStrip sounds like something you want to try you can buy it using my Amazon affiliate link here. Do you want to see the process in action? Watch the short video below to see all the steps that have just been detailed. Be sure to subscribe to our Youtube channel so you can see all the useful videos we're releasing so you can start by advancing your next project! Founder & senior editor love old houses, work with your hands, and train others on the excitement to make it yourself! It's all instructive if you give him a chance.
