# Windows call support

The Your Phone app has always been a great way to send and receive text messages on your PC or even flip android apps and screens, but it's even more useful now. Microsoft recently announced the introduction of a new option to send and receive phone calls from Android phones directly from Windows 10. Although the feature is still in pre-release, the phone call feature will gradually come to the Windows 10 Your Phone app, starting with the Windows Insider beta tester. These testers must be up to date with the Windows 10 May 2019 update and build an 18362,356 or later operating system to enjoy the feature. It may also take a few days for a new calling option to emerge, but Microsoft promises to be worth the wait, as there is plenty of functionality to enjoy. When available, Windows 10 users can answer incoming phone calls on their PC and initiate phone calls using an in-app dial or contact list. It is worth noting that calls can also be unused with custom text or sent directly to voicemail, just as you can on your Android phone. Other features include the ability to access recent calls on your computer and seamlessly transfer calls between your computer and your phone. However, there are several requirements that must be met in order to enjoy this new ability. Before 2, your Android phone must be running Android 7.0 or later. The Windows 10 computer must also have a Bluetooth radio. Today, we're excited to discover Windows Insider Calls. Take a look at this early examination and let us know what you think. There is no need to dig for your Android phone to answer your personal or work calls. You can now stay connected by simply replying (or not) to phone calls on your PC, Microsoft said. This new phone call option was first shown during Samsung's Galaxy Unpacked event, followed by another brief appearance during Microsoft's Surface event in New York. It joins many other features

of the Your Phone app, including the ability to see Android phone notifications in Windows 10 and copy or view the latest 25 photos from your Android phone. Most of these features - including dialing capabilities - are unlikely to be supported by iPhones or iOS due to the locked nature of the operating system. Microsoft editors' recommendations said on Monday (February 12th) that its Windows Defender Advanced Threat Protection (ATP) subscription service for the enterprise arrives in Windows 8.1 and Windows 7. Previously exclusive to Windows 10, the company now offers service on older platforms due to its slow transition to Windows 10 in a corporate environment. There is still a mix of Windows devices, so a single security microsoft's three operating systems for the best possible protection. This is not a version of Windows Defender installed on 10 computers. Instead, Windows Defender ATP is an all-in-one subscription service with several components: intelligence-based security analytics, app control, antivirus, solid protection, defense exploitation, and so on. It's a loaded package that covers multiple devices in a corporate environment and is managed by the company's security team using a cloud-based interface. Windows Defender is the original component of Windows 10, but the upgrade process from Windows 7 and 8.1 within the corporate environment costs both time and money. Large companies simply can't upgrade all computers to Windows 10 in one big swing. The transition will take some time, so Microsoft is now responding to requests for a Windows-based solution that covers all of these operating systems. The catch is that these customers need to be in the process of moving their computers to Windows 10. This means that all Computers running Windows 7 and Windows 8.1 are designed to upgrade windows 10. Throwing Support for Windows Defender on these two platforms is more of a temporary fix so corporate IT can better manage multiple devices with three operating systems until the upgrade process is complete. Specifically, windows 7 and Windows 8.1 machines will only have Windows Defender ATP Endpoint Detection and Response (EDR) functionality. According to Microsoft, this component provides comprehensive tracking tools to help you spot abnormalities and respond more quickly to attacks. All events are visible in the Windows Defender ATP Subscribers Cloud Console. Security teams benefit from correlated alerts for known and unknown adversaries, additional threat intelligence and a detailed machine timeline for further research and manual response capabilities, Microsoft says. This end solution for Windows 7 and Windows 8.1 can be run side by side with third-party antivirus products, but the company suggests Windows Defender Antivirus, aka System Center Endpoint Protection for enterprise. This spring, Microsoft will provide a public overview of the Windows Defender ATP for two older platforms, followed by a full launch sometime in the summer. Microsoft introduced its WINDOWS Defender ATP service in March 2016. Provides attack detection, attack analytics (who/how/why), response recommendations, network analysis, and so on. Microsoft continuously updates and works alongside other source services, including Microsoft Advanced Threat Analytics and Office 365 Advanced Threat Protection. Editor's recommendations By jmember on January 31, 2002 at 8:47 am This site can earn affiliate commissions from links on this page. Terms of use. Windows Support Center is one of the best sites dedicated to all versions of Windows. In addition to articles and frequently asked articles about how to manage different versions of Windows, the Website web site A rich set of home patches and link libraries to third-party support sites. Microsoft Microsoft announced onstage calls at a Samsung event in August, but that feature comes for all phones running Android 7 or later. Part of the Your Phone app, Calling is now being introduced in Windows Insider. If you have an Android phone, Calls will allow you to answer phone calls on your computer, start phone calls from your computer, access your phone history in the Phone app, and seamlessly transfer calls between your computer and Android phone while on call. You can even decline a call from your computer and send a custom text message in response, or simply send it to voicemail. All you'll need is an Android phone running Android 7.0 or later and a Windows 10 computer running Bluetooth —no specific Bluetooth version number or hardware feature required, as opposed to mirroring the screen from phone to computer. Finally, Microsoft says this feature will work as long as you use Windows 10 19H1 (it is currently a stable update for May 2019) with an operating system build number of 18362.356 or later. For now, it is being introduced into Windows Insider using windows 10 19H2 update development builds, which are likely to become stable sometime in October. This feature was announced in a blog post about building 18999 for the upcoming Windows 10 20H1 update, expected for release around April 2020 RELATED: Why Android users need the Windows 10 app Your phone Microsoft desktop OS allows users to install additional display languages from Windows 2000. This made Windows computers available to billions of people, but installing and transferring languages to your computer was not easy. Companies typically assigned only one language to a computer, limiting its use to those who understood that chosen language. Windows 8 Consumer Preview, which probably appears by the end of February, changes the way languages are handled and should make it easier for organizations with employees who speak multiple languages to share computers. It is not uncommon for business computers to be shared by workers, especially in workplaces open for multiple shifts. Tablets, on which Windows 8 will also launch, are even more likely to be shared if they are used for in-house tasks. In wednesday's Building Windows 8 blog, Ian Hamilton, program manager for the Windows International team, details changes to Windows 8 language options. Select from a filtered list of languages1. Central control While previous versions of Windows provided some languages through Windows Update and others through the Microsoft Download Center, one lining control panel will resolve all options associated with the Windows 8 language. This includes selecting the keyboard input language. Control displays currently installed languages and provides additional languages added. Select Add Language A list of languages to select that are filtered as you type. Selecting the language you want to add surprisingly doesn't add it; You still need to move on to the Download and Install Options setting, which is an insicreable extra step. This is most likely necessary for companies that have user account control enabled and will need to have an administrator perform an actual installation.2. The ability to switch language generalities through the Languages Control PanelAs selected and installed, new languages appear in the List of Control Panel Languages. With Control Panel, you can select the language you want to use and set it as the primary language, which will be enabled on the next application. You can also set your preferred input language in the same location. In a Microsoft blog post, Hamilton gives an example of choosing Hindi as the preferred language and Hindi Traditional as the preferred input language. This allows workers to have a native-friendly work environment while logged in, while still allowing others to use the device with their preferences.3 Additional languages Select primary language from the ListWindows 8 adds 14 new languages to the 95 that are supported in Windows 7 for a leading market out of a total of 109 languages, intended to support the native language for more than 4.5 billion people. Each language includes fonts, localized text, and input methods, and must provide support for nearly two million words as part of the entire user interface. In addition to the current American English standalone that OEMs use on new computers, there is now an English option in the UK for locations where it fits more naturally, such as India, Australia or South Africa. This standalone base language becomes a return language in cases where local resources are not available for the selected primary language.
