## How to split a clip in imovie with keyboard

Split a video clip in a project You can split a clip that you add to a project into two or three parts. This is useful if you want to add a transition or if you want to apply video effects or audio adjustments to only part of the clip. You cannot split a clip in the event browser. To split a video clip into two parts: Open the project so that it appears in the project browser, and then do one of the following: Move the game head (red vertical line) to the point where you want to split the clip, and then press Shift-S. Hold down the Control key, and then click where you want to split the clip art. On the shortcut menu that appears, select Split Clip. Select the clip area that starts from one end to the point where you want to split the clip, and then select Clip Art &gt; Split Clip. The Clip menu appears on the light gray bar at the top of the computer screen. Split a video clip into three parts: Open the project so that it appears in the project browser. Select the frame range that starts and ends in the middle of the clip (don't select end from both ends). Do one of the following &gt;: The Clip menu appears on the light gray bar at the top of the computer screen. Press Command-Shift-S only if you have selected more than five frames. If you change your mind about splitting the clip, press Command-Z to take the split back. If you've already moved a clip piece, place the pieces next to each other in their original locations, select one of the clips, and then select Clip &gt; Join to Clip. Last updated guest on 1/1/2010Ad for a fee: iMovie Thanks for the feedback. We've been sharing a lot of iMovie crap in recent months. Now it's time to help you with something you're sure to find useful: iMovie hotkeys. Making any app on a Mac can be much faster and easier with a keyboard shortcut. And when it comes to iMovie, there are a lot of them. Many you remember and many you do not remember, but this useful guide gives you the most common.iMovie keyboard shortcutsIf you want to go to a certain group of keyboard shortcuts, here's how they are distributed. Manage projects You can create a new project or move it to the Recycle Bin with a few key clicks. Create a new movie project. Command + NMove entry in the Recycle Bin: Command + DeleteMoving round iMovie is simple enough for a mouse or touchpad, but these keyboard shortcuts are handy as well. Show elements of the iMovie browser that are in the top part of the window:Media: Command + 1Audio: Command + 2Titles: Command + 3Maps and Backgrounds: Command + 4Sound Effect: Command + 5Transitions: Command + 6Show Libraries List: Shift + Command + 1Go Library View: 1Mine Projects View: 2Minimated Window: Command + MSelect and change the objects: You want to choose an entry to play or change these shortcuts to make it easy. Select clip: XSelect part of the clip: Hold R and dragSelect all clips: Command + A Deselect all clips: Shift + Command + ACut the selected text or frame: Command + XCopy selected text or frame: Command + / (slash)Undo your last action: Command + ZRedo your last action: Shift + Command + ZPlay and control your movie You can use these directs to play your movie or selected items and control that playback. Play entry: / (slash)Play item from the beginning: \ (backslash)Play the entry under the frame playhead: SpacebarPlay entry full screen: Shift + Command + FExit full screen: EscapeMove playhead one frame: Right arrow Move gel back to one frame: Left arrowJump on to the next clip browser: Down arrow Jump at the beginning or previous clip timeline: Up arrowLoop playback: Command + LControl audiol If you use the sound of your iMovie creations, keep these keyboard shortcuts in mind. Open voiceover controls: VMute audio: Shift + Command + MDetach audio: Option + Command + BWrapping it up Hope some of these iMovie hotkeys come in handy for you, but it's not all of them! For a complete list of all available iMovie keyboard shortcuts on the Apple Support site. You can take a look at our iMovie section of the latest tutorials such as how to reduce background noise, set shaky video, or tweet words from your movies. Is there anything about iMovie that you want to see us cover that we don't have? Let us know below or message us on Twitter! All Apple computers with hundreds of iMovie software. Video clips from your Photos albums are automatically available for iMovie. You can also import media from your iPad, iPhone or iPod touch, file-based cameras, and tape cameras. You can even save the video directly to iMovie. No matter what method you use, take iMovie time to clean and organize different clips after importing the video. This will keep your project in order and make it easier to find what you're looking for. Before you can work with the iMovie project, you must create a project and import video clips. Open the iMovie software. At the top of the screen, click the Project tab. Click a blank thumbnail named Create New, and then click Movie in the pop-up window. The new project screen will be given a default name. At the top of the screen, click Projects and enter a project name in the pop-up box. On the File &gt; Import Media menu, click File &gt; Import Media. To import a video clip from the Photos library, click Photos in the left panel of iMovie, and then click the album that contains the video picture from the drop-down menu at the top of the screen to see thumbnails of video clips. Click the thumbnail of the video clip and drag it to the timeline, which is the workspace at the bottom of the screen. If the video you want to use isn't in the Photos app, click the name or other location of your computer in the left panel of iMovies, and then locate the video clip on your desktop, home folder, or other computer. Highlight it and click Import Selected. Repeat with any additional video clips that you plan to use in your iMovie project. If you have long clips that contain multiple scenes, split these large clips into several smaller clips, each containing only one scene. To do this, drag the clip that you want to share into the iMovie timeline, and select it by clicking it. Use YOUR MOUSE to move the playhead first frame to the new scene and click to place it. Click , and then click Split Clip. Alternatively, press Command +B to split the original clip into two separate scenes. If you're not using one of the clips, click it, and then press Delete. If some of your video footage is suspicious, out of focus or unusable for any other reason, it's best to trash this footage so it doesn't clutter up your project and take up space. You can remove unusable recordings from unusable material in two ways: split or crop. Each video that is deleted using one of these methods disappears from iMovie for good, but not the original file. It won't be shown in the Recycle Bin, but if you decide later that you want to use it, you'll need to import it again. If the unusable recording is at the beginning or end of the clip, simply delete this section and delete it. This is the best way to go if the part you don't want to use is at the beginning or end of the clip. If you want to use a video in the middle of a longer clip, you can use the iMovie shortcut. On the timeline, select the clip. Hold down the r key while dragging over the frames you want to keep. The selection is identified by a yellow frame. Press and hold the Control key, and then click the selected frame. On the shortcut menu, click Trim Selection. If you add clip art to your project and later decide you don't want to use them, just select the clip art you want to get rid of and click Delete. It removes clips from iMovie, but does not affect the original media files; they will be available later if you decide that you need them. Because your clips have been cleaned and organized, it's much easier to organize, add photos, add transitions, and create a video project. Project.
