Best youth baseball bats 2016

Although the 2018 U.S. Baseball Leagues have adopted a new rule (see changes here). We still want to be able to give you older bat reviews of your comparison with the new upcoming season. If you are looking for all new 2018 U.S. Youth Baseball bats, please scroll through our navigation bar for the latest releases and feedback. * Please note that these bats will not be eligible for the upcoming 2018 U.S. baseball season.*SUMMARY: The 2016 Centerfire hybrid was the last youth bat produced by the Anderson's 2008 Nano Tek XP, Centerfire includes a 2 piece hybrid design that provides ultra-balanced swing weights faster and fluid swings through the strike zone. The barrel features Anderson's unique AB 9,000 aerospace alloy, which produces optimum power, stronger strength and deafening sound when colliding with a bomb. The multi-layer composite handle prevents irritating shock vibrations in the hitter's hands while distributing a faster whip and stiff grip on the handle. OUR REVIEW: Much like our assessment of Anderson Techzilla XP, 2016 Centerfire received consistently positive ratings from our team and pool hitters. In fact, our volunteer sluggers gave Centerfire one of the highest overall ratings among any stick in the vibration control and Grip/Comfort categories. On their scorecards, many of our players notated the impressive loud ping heard during the impact. One child stated: The best feeling in baseball is when your bat tells you how well you hit it. During our Pop analysis, Centerfire displayed a huge distance, especially a baseball bat designed for more speed than power. The combination of Anderson's aerospace alloy and composite handle created a perfect mix of power, comfort and speed for our hitters. 2018 Young Bats highly recommend the 2016 Anderson Centerfire as a bat for players of all statures, especially those who want to improve the overall efficiency of their swing. Although this bat as a training youth bat! SUMMARY: When developing the 2016 Maxum youth bat, Combat had one singular intention in mind to create the most effective and powerful fully assembled young baseball bat ever produced. The Maxum features a one-piece composite design that uses Combat's Precision Molding Technology. With this method, Maxum distributes a consistent pop across the barrel with expanded sweet spots that are documented to be larger than any other 2 1/4 barrel ever made. In addition to unparalleled power potential, Maxum also carries the lightest swing weight of any Combat ever made. Needless to say, the execution of this has the potential to raise the hitter's offensive productivity to a new level. OUR REVIEW: Our assessment of combat record breaking young bat garnered a lot of anticipation from our young hitters. The positive feedback made on Maxum was overwhelming. First, it received high scores from our volunteers in each category, including an almost perfect score for Grip & amp; Comfort. One particular hitter announced Maxum gave him a stiff and relaxed feel. At the pop station, a significant proportion of players who considered themselves contact hitters stated that they had never experienced having it much pop ever before. About 1 out of 7 hitters notated the feeling of unwanted shock vibrations at the handle. After enduring hundreds of swings during our assessment, it turned out to be very durable, as well as with the structure of the bats well intact. We highly recommend Combat Maxum for young baseball players of all ages, shapes and sizes. SUMMARY: The 2016 Easton Mako has many technological advances focused on maximizing attack productivity and overall comfort for the hitter. The most significant aspect of these makos is undoubtedly the patented TCT[™] Thermo Composite Technology. Each Mako bat consists of this formulated material, which produces faster swing speed, expanded balance and a more shocking collision with the ball. In 2016 Mako also demonstrates Easton's two-piece ConneXion, which uses a special hinges between the barrel and handles keeping them separated yet securely connected. This allows you to maximize the transfer of energy and prevent irritating shock vibrations in the hitter's hands. OUR REVIEW: By concluding our assessment of the 2016 Mako youth bat, we can safely point out that overall performance is definitely one of the best young bats we have ever tested. Make received high scores in all five categories we analyze along with the two-piece ConneXionTM turned out to provide our hitters with a smooth transition of energy and a comfortable grip. During the observation portion of the assessment, this bat showcased the perfect blend of pop, speed and fluidity. One particular hitter's scorecard stated: This is the best bats on the market and is highly recommended by our team. SUMMARY: 2016 Mako XL uses many of the advanced technological properties found in standard Mako, except for the final loaded barrel. The XL edition includes a final loaded variation designed to provide an unbeatable level of pop hitters who can handle off balance weight distribution. Similar to standard Mako, Mako XL uses Easton's TCTTM Thermo Composite Technology. This Innovation offers hitters increased bat speed, stronger endurance, and expanded balance of space, which greatly enhances the trampoline's impact on baseball. This bat also includes Easton's patented Two-Piece ConneXion, which applies special hinge technology to the barrel and handle keeping them attached without touching. This design maximizes energy transfer while eliminating any shockwave vibrations in the hitter's hands. As mentioned above, the main difference between Mako XL and standard Mako is the final loaded barrel. XL brings an uneven weight distribution over the entire length of the bats, making it much easier to achieve fluid-level swings. OUR REVIEW: Parents, if you find yourself at a crossroads between purchasing a standard Mako or Mako XL for your child, are some of the essential factors one needs to consider: Throughout the evaluation process, my staff and I were thoroughly impressed with the added pop of Mako XL vs. Standard Mako. Until your child has the skills and abilities to operate the bat with an uneven weight distribution, Mako XL will add distance and power to the swing. Parents please don't underestimate the effect the final loaded barrel has on the hitter balance and overall level of comfort. Since this model is equipped with more top heavy barrel. After reviewing our volunteer hitter's scorecards a significant portion mentioned feeling a bit off with their swing. Mako XL was designed for qualified players who want to hit on power with every swing. Contact hitters should shy away from this bat and try a standard Mako that offers a balanced swing weight. That said, if your child possesses the size and ability to operate the final loaded barrel, we highly recommend the 2016 Mako XL. SUMMARY: The 2016 Easton S2 was designed to increase bat speed for hitters who prefer hybrid bats. The main feature HMX Hyperlite Matrix aluminum giving the bat a significantly higher pop value compared to most alloy bats on the market. The handle features Easton's SIC black carbon composite providing a firm and stable grip. S2 is also used with the company's patented two-piece M, which combines barrels and handles. This upgrade optimizes energy transfer and reduces impact vibrations in the hands of the hitter. OUR REVIEW: During the 2016 Easton S2 evaluation process, we will centralize our efforts in terms of bat speed, impact vibration and overall comfort. The design of these bats was never designed for power hitters. Our team found it the best way to gage S2 involved using volunteer hitters who emphasize contact hitting vs slugging power. When scorecards were reviewed, most contact hitters gave S2 high scores in the Grip/Comfort and Shock Vibration. Not many hitters mentioned a significant increase in bat speed, however most of our hitters declared felt loose and comfy when swinging S2. This information tells us that S2 is a great bat for players who might struggle to find pitch vs. driving it. It's definitely a big bat for less experienced or smaller contact hitters when switching to a higher division of baseball. SUMMARY: Easton 2016 S3 line of fully aluminum bats serves a singulinant yet important goal. Its design is centralized for maximizing the hitter's bat speed. From crank to barrel, these bats are equipped with Easton's patented HMX Hyperlite Matrix aluminum alloy, which improves the sweet spot and provides greater durability compared to older Easton models of aluminum bats. The composition of one piece of barrel handle creates an open and direct channel for power transfer from the hitter's hands to the focal point. With its super lightweight design and stiff grip, Easton created the S3 lacks in raw power, it more than compensates with faster swings and endurance. If you are in the market for a bat that is sticking to power, the S3 is not for you. It may seem counterintuitive for players who face difficulties seeing and time pitch should consider S3. While the S2 is also aimed at increasing bat speed, it's a bit heavier making it not as fast as the S3. During the evaluation, hitters aged 5-7 years who described themselves as contact hitters gave S3 high points in the Grip & amp; Comfort. Parents, we recommend you please buy a bat that best compliments your child's playing style. We highly recommend this bat for young players demonstrating hard time seeing the ball. Also, we wouldn't recommend using this bat in a division where pitchers average pitch speeds of 50MPH and higher. SUMMARY: IIn 2015, the Louisville Slugger launched its vis innovative line of youth baseball bats under the name Prime 915, which eventually became one of the highest rated composite bats this year. The 2016 Prime 916 is equipped with the same technological advancements, but offers a slightly larger barrel. 916 uses Louisville Slugger's patented TRU3 connection technology, which synchronizes the handle and barrel without two being physically touching. Keeping both pieces separate, but Fused, any uterus shock vibrations are absorbed before reaching the handle, allowing evenly transfer of energy to create maximum potential for power. Both barrel and handle consist of the Louisville Slugger's patented FCS (molten carbon structure) composite, which provides expanded balance of space and improved durability with a balanced swing weight. OUR REVIEW: To no surprise, Prime 916 received tremendous feedback from our volunteer hitters. Many players notated giving a significant pop off the bat and feeling very little discomfort after the grip. One hitter note that Prime 916 had a super comfy feel when clenching lizard Skins Grip. Bats FCS composite makeup combined with Louisville Slugger's TRU3 connection technology certainly produces significant power and bat speed. Another hitter mentioned in his scorecard every swing I felt more confident! Prime 916 is definitely a bat we recommend for all types of hitters, especially those who prefer heavier composites over lighter alloys. SUMMARY: The 2016 Louisville Slugger Select 716 is specifically designed to manage a strong delivery on the ball, but is one of the lightest hybrid bats on the market. This bat is a company TRU3 connection technology that provides an alloy barrel and composite handle. This unique 3 piece construction provides an incredible pop while eliminating shock vibrations. Both of these attributes combined with lizard leather handle provides at lightweight AC21 alloy barrel greatly increase the power and speed of baseball. A 100% fully composite handle with lizard leather handle provides an incredible pop while eliminating shock vibrations. Both of these attributes combined with a durable and lightweight AC21 alloy barrel greatly increase the power and speed of baseball. A 100% fully composite handle with lizard leather handle provides an incredible pop while eliminating shock vibrations. Both of these attributes combined with a durable and lightweight AC21 alloy barrel greatly increase the power and speed of baseball. A 100% fully composite handle with lizard leather handle with liz 2016 Louisville review, Select 716, the most popular aspect of this bat, included the number of solid connections recorded by our contact hitters. This information tells us that feature light weight structural designs tend to sacrifice some degree of pop to compensate for the increasing speed. As for Select 716, our team observed an impressive amount of energy. TRU3's dynamic socket technology proved to be effective, providing a comfortable feel for an almost perfect result from our Grip/Comfort and Vibration Control categories. For parents, it's worth noting that the total barrel size of this bat is smaller than the Louisville Slugger's other line of 2016 bats called Prime 916. However, if bat speed is the main area of improvement for your child, the Select 716 is a great option. SUMMARY: Due to a compelling amount of positive feedback on 2015 Nighthawk softball bats, Mizuno has decided to produce young baseball players. The 2016 Nighthawk youth bat includes a hybrid design with a -13 drop. The alloy barrel and composite handle are tightly connected using Mizuno's patented 2-Piece LINK design, which increases the total barrel size, increases the balance of space and strengthens durability, while creating a smaller swing weight. Usually, if a player's goal is to speed up his or her bat speed, they consider using fully aluminum bats that open more channels of shock vibrations on the hands. The 2016 Nighthawk allows young hitters to swing a quick bat without sacrificing comfort. OUR REVIEW: Going into our Blackhawk assessment, our team was very curious if the bat could deliver the same performance from softball. Just because it proved effective in one sport does not guarantee a similar result in another. Much to our delight, Mizuno's 2016 Nighthawk received high ratings from our volunteer hitters. The aluminum barrel combined with its unique wall design distributes the compression power of the Pop station, providing loud sound as well. Many Scorecards specifically mention ping sound like one of the loudest they have ever heard. The black onyix composite handle, dressed in a leather handle, provided our players with a pleasant grip that one particular child indicates as a super comfortable feeling. In fact, Mizuno received an almost perfect score in the categories Grip/Comfort and Shock Vibration proving Mizuno's 2 Piece LINK design is extremely effective. The 2016 Nighthawk youth bat is perfect for young players working with bat speed without losing much pop. We highly recommend that these baseball bat contact hitters want to make a consistently stable connection. Connection.
