6 nitrogen and phosphorus cycles worksheet

1: What percentage of nitrogen and phosphorus are in the body of animal feed? What do we need nitrogen to do? We need nitrogen to make aminoacids, which make proteins that make our whole body up.3: What do we need phosphorus to make? We need phosphorus because it is part of our DNA and RNA is also P in PTA. Water and rock are a good source of phosphorus. What percentage of the atmosphere is nitrogen? In any form, 78 percent of the atmosphere is made of nitrogen. What is the chemical formula for nitrates? NO_3^- ? NO_2^- ? NH_4^+ ?
6: Nitrogen fixation is when nitrogen molecules break out into nitrites and nitrates and ammonium all in order to absorb nitrogen nutrients.7: What is nitrogen bacteria modified? They are located in the soil, the water is more specific. Legumes.8: What plants are in the legumes? What does it mean that they create biological relationships? Biological relationships mean that two organisms benefit equally from each other.9: What form of nitrogen is used by plants? Plants prefer to use NO_2 , or how we call it nitrite nitrogen, an enzyme that makes nitrogen molecules more useful.10: Nitritis bacteria are enlarged to use ammonia and converted into NO_3 nitrate- and nitrite NO_2 .11: What other things can break nitrogen molecules apart? Humans have developed a machine that can break synthetic nitrogen molecules apart.12: What is Denitrifying Bacteria? Denitrifying bacteria are enlarged to burn nitrogen oxides and release them, re-introducing nitrogen gas by the enzyme Nitrate Reductase around phosphorus 13: What is special about the phosphorus cycle is that the only circuit that is not related to the atmosphere.14: What is Lithosphere? What kind of special stones are rich in phosphorus? It is also known as the crust. The phosphorus-rich rock is a sedimentary rock on the old ocean floor.15: What is lithotroph? Is it a kind of bacteria-eating stone.16: How does phosphate end up in the water? They end up in the water when some of these rocks are exposed, they erode into the water, soil and then they dissolve into the water 17: Can a single phosphorus atom get stuck in a cycle? It can be stuck in 100,000 years.18: The phosphorus circuit diagram below: What is the diagram shown on the right side? >>>19: What is the main ingredient in fertilizer? Why is nitrogen and phosphorus so bad for the environment? The body of the animal is made of nitrogen 3% and 1% of phosphorus.2: What do we need nitrogen to do? We need nitrogen to make proteins in blood muscle, deoxyribonucleic acid, skin, hair and nails 3: We need phosphorus to do anything, we need phosphorus because it is part of DNA and RNA is also P in PTA. Water and rock are a good source of phosphorus.
Nitrogen cycle 4: What percentage of the atmosphere is nitrogen? In any form, 78 percent of the atmosphere is made of nitrogen. What is the chemical formula for nitrates? NO_2^- ? NH_4^+ ? NO_3^- ? Nitrogen fixation is a process of nitrogen gas from the air that is transformed into a compound in the soil by bacteria that live in the root lumps of certain plants (legumes). The nitrogen-modified bacterium is called diazotroph.8: What plants are in the legumes? Biological relationships are obligatory, which means that the two symbionts all depend on each other to survive. Plants include peanuts, such as the pictures I have above, nuts and other plants. This is a very broad definition of the family legume.9: What form of nitrogen is used by plants? Plants prefer to use NO_2 , or how we call it nitrite nitrogen, an enzyme that makes nitrogen molecules more useful.10: Nitritis bacteria refers to chemotherapy or chemolithotrophs based on genus (Nitrosomonas, Nitroscoccus, Nitrobacter, Nitrococcus), bacteria that grow by Many of these species have a complex internal membrane system that is the place for key enzymes in nitrification.11: What other things can break nitrogen molecules apart? Humans have developed a machine that can break synthetic nitrogen molecules apart.12: What is Denitrifying Bacteria? Denitrifying bacteria are enlarged to burn nitrogen oxides and release them, re-introducing nitrogen gas by the enzyme Nitrate Reductase around phosphorus 13: Phosphorus enters the environment from rocks or deposits placed on Earth many years ago. Phosphate stones are a commercially available form calledapatite phosphate, incorporated into many molecules needed for life, such as ATP, adenosine triphosphate, which is important in storage and energy consumption. It is also in the spine of DNA and RNA, which involves coding for genetics.14: What is Lithosphere? What kind of special stone is rich in phosphorus? The lithosphere ocean consists mainly of mafic (rich in magnesium and iron). Crust and ultramafic (more than 90% mafic) cloak and denser than continental lithosphere.15: What is lithotroph? They end up in the water when some of these rocks are exposed, they erode into the soil, and then they dissolve into the water.17: How long can a single phosphorus atom get stuck in a cycle? It can be stuck in a cycle for it can go on for a long time. It can be stuck in 100,000 years of 18: phosphorus cycle diagram below: <==19: The main ingredients in fertilizers are nitrogen and phosphorus.20: Why is nitrogen and phosphorus so bad for the environment? Descontrol the balance they use regularly.
