## Electrolysis at home device

Have you ever wondered how this thing works? Explore the inner workings of many common devices and inventions, as well as those that are not as common, such as compasses, gyroscopes and bug zappers. Achieving permanently fuzz-free status is a unit of the beauty world: magnificent, mythical and seemingly elusive (also see: Lily Collins' eyebrows, Connie Britton's hair). Enter: electrolysis. This method of hair removal promises to permanently ingest all unwanted hair on the body – yes, for real. While it's not a new development, it's still not as widely known as, say, laser hair removal. To get the facts, we spoke with Dr. Anthony Youn, a board-certified plastic surgeon and assistant professor of surgery at Oakland University School of Medicine William Beaumont (he's also a frequent skin expert on shows like Good Morning America and Access Hollywood). Read on to get 411 on the electrolysis. Bo Egestrom What is electrolysis? Electrolysis is the application of electrical current to an individual hair follicle as a way of destroying it, youn says. How does an electric current get to the hair follicles? Essentially, the teeny, tiny needle (usually finer than the hair it's zapping) is inserted along the hair shaft. Louis Vuitton will it work for me? If the thought of needles and electrical currents hasn't scared you yet, and you have the hair you want nix, then electrolysis will probably work for you. Anyone who has hair that wants to get rid of, and can handle the discomfort and cost, is a reasonable candidate for electrolysis, youn says. And, unlike laser hair removal, electrolysis will work on women with blonde or gray hair. Alexander Neumann Pain Factor Remember the discomfort Youn mentioned earlier? It's not something to worry about too much. We'd be lying if we said the experience was on a par with a relaxing massage, but it's not unbearable either – in many cases, it seems like a small pinch. If you're worried about being in pain, Youn says you can apply a topical anesthetic, like a lidocain topical cream, which will help make the treatment more enjoyable. What do you get treatment tin tells you that there may be less redness and burning. Your skin will most likely be sensitive, so treat it gently. You can also use a topical antibiotic to prevent any infection or acne that might occur, but Youn says to make sure you talk about it with your electrologist first. Katja Rahlws / Vogue Paris Where can it be done? Youn says that the most popular location for electrolysis is eyebrows, followed by hair on other parts of the face (think: upper lip, hairline, chin and sideboards). Fortunately, the magical powers of electrolysis are not limited to removing fuzz above the neck; it can be used in any area that is covered with hair you do not want, including bikini area, armpits, legs and stomach. you'll get Stop using any products containing retinol or tretinoin on your face at least a week before the appointment, youn warns. Other things you can do to prepare yourself: Stay hydrated, peel gently before treatment and remove all makeup. Charles Guo How long will that take? Typically, many treatments are needed for electrolysis to work, even as much as 15-20, youn says. So this is an investment, both in time and in money. Sessions can last from 15 minutes to an hour, and the cost depends on a variety of factors, such as the size of the area you treat, and even the city where you live (according to the American Association of Electrology, large cities generally have higher rates than smaller ones). But don't skimp on costs: This is a professional procedure and should therefore be done by a professional (so maybe pass on Groupon offers). Seek counselling at the office (most places will offer one, and they can include short treatment so you can see what the procedure is). So, you don't have to commit to the first place you go – meet a few offices before handing over your last rose (a la The Bachelorette). Terry Richardson / H&M Million Dollar Question: Is It Really Permanent? Here's the best part: The results are permanent. Once the hair follicle is destroyed, it won't grow back, says Dr Youn. No more bikini wax? We're intrigued. Your recorder isn't the only piece of technology you have at home that's on track to become obsolete | Source: crosleyradio.com It feels great to be on the cusp of new technology, to have the latest, cutting-edge gadgets in hand as they get ready on the shelves and to know what kind of devices you can expect to see in the future. Yet as technology evolves more and more, we outgrow certain things. For example, although cassettes and CDs are still there today, it is not common to see people using them. These days, a lot of our content is stored digitally, through hard drives or in the cloud. Of course, there are still DVDs, Blu-Ray discs and video games that are packed on a physical disc, but they also make their way to the digital space. We'll see less and less of them in the end. This is, admittedly, a terrible argument, because however you cut it, the physical media will always be there in some form or another. Many people are not willing to give up material assets, especially because they offer something to resell or charge. So, which gadgets will soon become obsolete? What are some things that will disappear in a decade, maybe even just a few years? 1. Low-end and compact digital cameras Low-end digital cameras are on the way | Source: samsung.com 8 to 12 megapixel cameras are now standard in most smartphones. In just a few years, these cameras will offer even higher resolutions and even better lenses. People who carry their phones everywhere, there is absolutely no reason to carry a compact digital camera as well. In fact, most families and consumers have completely rejected personal cameras. It doesn't hurt that these phones can even record HD-quality video. The only exception to this rule would be small professional cameras, often mirrorless systems, that photography enthusiasts wear for better shots. Let's be honest: smartphone cameras are convenient, but they don't always deliver the most enjoyable photos. Neither are low-end digital cameras, for that matter. Still, you can expect to see sub-par cameras, about \$300 or less, start to fade. 2. Remote controls Remote controls are also set to become obsolete | Source: logitech.com reading the title of this gadget, you will probably blurt out pointlessly as loudly as you can. Just listen to us. As long as we can remember, electronic devices were packed with a compatible remote control to feed our laziness. TVs, stereos, ceiling fans, vehicles, garage doors and even sometimes lighting fixtures come bundled with a wireless remote control. But soon, there will be absolutely no reason for them. Why? Because we all carry smartphones in our pockets that can do the same thing, either through an integrated IR sensor, or with an app and Wi-Fi connection. Imagine carrying all those remotes in one device? Talk about convenience! The remote still has their place, of course, so we're not suggesting they disappear into thin air tomorrow. However, we wouldn't be surprised if manufacturers start advertising free apps to manage their devices instead of a remote control. We're already starting to see smart home technology take off as a wide range of stupid electronics and devices become smart and ready for the internet. It's only a matter of time before the remote controls are completely unnecessary. And if your TV or devices can support voice commands, then you won't even need to communicate with the control interface. All you have to do is talk to the device to get it to do what you want. 3. Traditional landline phones Landline phones may not be such a common sight in the near future | Source: vtech.com to be honest, we're not exactly sure why cable and phone providers aren't willing to let landline phones die. The only places that really need landline phones are business and public settings where landlines are needed, such as hospitals, call centres or sales offices. Most of the time, people who have a landline phone in their home were forced to buy the service as part of a package from their cable company or Internet service provider. Some telecommunications companies will not provide cable or Internet service unless you pay for the complete package. Nevertheless, traditional fixed It's going to be obsolete soon. obsolete. devices and smartphones take cake as replacements, but there are other channels. Consider VoIP services like Skype, Google Hangouts, Jitsi and the like. Quite a few of these services are cheap or free - certainly cheaper than paying a monthly fixed service fee and buying a phone to use. 4. Alarm clocks Thanks to smartphones that most people own, a standalone alarm clock is unlikely to be for much longer | Source: acurite.com Think About This. When was the last time you used an actual, self-contained alarm clock? Chances are you're probably using your smartphone to wake up on the schedule. If not your smartphone, then some other smart gadget like fitness trackers, tablets or maybe even home automation systems. Honestly, why would he wake up to the sharp, boring tones of an alarm clock? You can choose your favorite tune to encourage you into the land of the living in the morning - or night - whenever you set the alarm. And unlike a digital alarm clock, your phone won't fully reset and won't sound your morning alarm if the current happens to be flashing in the middle of the night. A 2014 survey found that smartphone and cell phone owners used their devices as an alarm clock more than they used for phones. Pretty crazy, isn't it? Check out all the third-party alarm clock apps you can download for Android and iOS and you'll soon realize that your standalone alarm clock is outdated. 5. Standalone GPS navigation systems Standalone GPS unit no longer left | Source: garmin.com are once again looking at another form of technology that has become unnecessary thanks to smartphones. Portable GPS navigation devices — like the ones TomTom and Garmin sell — will soon become obsolete. Not only do most smartphones offer this functionality, but a lot of vehicles come with navigation systems mounted on dashes right out of the factory. Therefore, unless you drive an older car and own a smartphone, there is no reason to choose a separate GPS device. Couple that with the fact that platforms like Google Maps and Apple Maps are continuously improving and updating with new information and you have every reason to leave traditional GPS systems behind. With a smartphone, there's no need to download firmware updates or new area maps. Everything is available flawlessly and can be accessed from anywhere you have a wireless signal. Did we mention the fact that you don't have to pay extra for GPS functionality on your smartphone? Yes, there's that, too. too much.
