See the Whirlpool Washer Error Code F21 in the broadcast? What does it mean and how to fix it? Hew we will answer these questions and give you tips on how to troubleshoot and fix it. Normally, the Whirlpool Duet's first/top load rate will keep flashing with the F21 error code when it's faced with a particular issue. The washer does not complete the washing cycle, and the clothes will not be completely washed. You can do some DIY fixes to solve this problem. First, you need to know what this error code means and what components to check. The Whirlpool Scatter Error Code F21 means that the Whirlpool Medal is capable of draining water. This problem occurs when the drain pump or drain hose is clogged with dirt and debris causing water to jam and the washing machine cannot drain the water. So, when the seer shows this error, the view holder takes a very long time or can't suck the water out of the tub. Let's see the possible causes and the fix. Fix 1: Reset the error code When the F21 error appears, try pressing pause/cancel, which stops the current washing cycle. If you see that the water is still in the hot tub, then press the Drain/Spin button. This forces the start of the secondary drain cycle, which helps to remove water from the tub. When all the water in the tub is empty, you can start the new washing cycle again by pressing the Start button. Hopefully it will fix the issue. If even after resetting the error code, you still get the Whirlpool Washer Error code F21, then the problem may be with the drain hose. First, take a towel and put it on the floor, which will help protect the floor from any water that leaks. Now pull the drain hose out of your Whirlpool. Carefully clean the drain hose entrance. Remove the hose in hand and shake firmly to remove and remove the clogs. When reconnecting, make sure that the drain hose straightens, as any bending or twisting of the hose may cause draining problems. READ HOW to fix gas dryer without heating [SOLVED] - ErrorFixIt It is very important that the drain hose is properly installed in the drain facility/standpipe so that water can be emptied out effectively. So any problems with the Standpipe or channel installation can lead to the F21 error code. Let's see how to fend it off. If the drain hose is connected to a standing tube, take the following steps. Carefully measure the distance from the bottom of the hot tub aher to the top of the introductory hose (the connection point of the hose and standpipe). If the distance is more than 96 inches, pull out the drain hose and place it lower on the standing tube. Secure firmly. If you place the drain hose directly in a standing tube, take the following steps. If you notice that the drain hose hose push it too far into the support tube and pull the hose slightly upwards. This will help to make the air hole in the drain hose and drain and prevent clogging issues. Hopefully the F21 Default will now go away. The Whirlpool Duet washing machine is specially designed to be very energy efficient. Therefore, it also requires a detergent with very high efficiency. Usually these detergents are labeled as HE. It is strongly recommended to use this type of cleaning products. The use of the wrong type of detergent during the washing cycle may cause the formation of excess foam. All these foams can clog the drain hose, which can cause the F21 error code. You can also go for a new Drain/Spin cycle that will help you remove excess foam and soap and help you solve the problem. When using THE HE detergent, refer to the instructions for use of the product and use the appropriate amount for washing. READ why is the freezer freezing up? How to fix [SOLVED] - ErrorFixItFix#5: Faulty engine Another possible cause of the problem is the faulty engine. So, the first step is to make sure the dran pump is getting an adequate power supply when the drain cycle starts. Please note that the drain pump should receive a 120V voltage when running. So, even if it looks like the drain pump isn't working and is faulty, this could be due to a faulty power supply control board that doesn't send enough power supply drain pumps to begin with. If you have decided that Drain Pump is getting the right power supply, then it is almost certain that the drain pump is defective. You need to do some troubleshooting and find the problem with the pump. Disassemble the pump and check for obstructions. Use electrical equipment, such as multimeters, to see if there are electrical or mechanical problems. You need to replace the faulty drain pump with the new one. You can also watch the video below to fix the F21 bug Hopefully the above fixes will help you solve the whirlpool washer error code. If you are confused, then always take help from a professional and get the issue solved. Please do not comment on the question or suggestion and we will gladly help. Keep visiting ErrorFixIt. What does F21 mean for Whirlpool Aher? I have a Whirlpool Duet first loading arand that keeps flashing the F21 code. When this code is displayed, the wording is denied to complete certain cycles. What causes the Whirlpool error code F21? Is there anything I can do to fix myself without having to call the device repair service? Whirlpool Washer Error code F21 - drain error - How to fix it? The Whirlpool washer fault code F21 means that the washing machine is a drainage issue, which means the drain pump is either clogged or the drain hose is clogged and the washer has problems draining the water out. Other the subtor takes too long for the water to drain out of the tub. Most Most The reason for the F21 error code appears whirlpool-fold: -The inducting tube is located at the back, it may be blocked by lint, or it may be bent. -The drain filter of the drain pump may be cloded or cloded. -The tug at the bottom of the drain pump can be a significant blockage. -The underrunner drain pump may be defective and must be removed and replaced. Whirlpool Washer – F21 error code on the DISPLAY Other reasons for displaying the F21 error code on the Whirlpool washer: - The cable harness of the drain pump is damaged or the harness itself does not have a secure connection to the main control board or the main control board. -Communication between the drain pump and the main control unit has been interrupted if the pressure switch is defective. -The drain where the water flows out may clogged. (The drain in the wall or on the floor where the drain hose drains) Try it first to see if the Vortex will CLEAR the default code... Press PAUSE/CANCEL twice to delete the display. Here's what to do if the Whirlpool washer shows F21 error code: 1 - Check the drain hose located at the back of the washer to make sure it's not clogged, bent, or blocked in any way. Remove the drain hose and check that there is no large lint blockage preventing the washer from displacing the water. Also, make sure that the drain in the wall (where the drain hose drains the water) is not clogged or clogged. (Be careful about sliding the iner way forward - pay attention to the water pipes and the power line so you don't pull them out) NOTE: If the drain hose is clogged and the drain hose is clogged due to clogging or bends, run a test to see if the F21 fault has been faulted. 2 - Remove the computer from the washing machine to gain access to the drain pump, the drain filter, and the wires inside the washer by removing the lower lower access panel. (You can reach the drain pump and drain pump filter by removing the screws from the front lower panel of the washer –you'll then see the drain pump, the drain filter (lint trap), and the wires from the drain pump) How to achieve the drain pump and filter whirlpool arawing F21 Error code Whirlpool duet aher no drain - F21 Error Fix 3 - If the power is removed from the sprayer and the lower panel is removed, place a large towel or low profile cooking tray on the floor to catch the water, which is still the drain filter. Unscrep the drain filter, a little water will drain away, and there will probably be a lot of foreign objects inside that block the flow of water. Clean the debris filter (lint trap) and put the cap back on. (In general, the drain pump filter is filled with debris, and when the water tries to drain, the debris is prevented from draining the water, and F21 error appears) NOTE: If the drain filter is clogged and the filter is everything is reinstalled together and run a test wash to see if the F21 error is now cleared. Whirlpool overcrowding with fault code F21 - Check pump and filter for blockage 4 - Check that the cable harness of the drain pump is secure and that there is no visible damage to the wires. (Loose or damaged wires do not allow power to be sent to the drain pump and therefore the drain pump cannot drain) Note: If the drain pump had a loose wire harness and ensured it could get everything back together and run a test wash to see if the F21 fault was now cleared. 5 - Check the drainage lines that are connected to the drain pump to make sure there is no blockage in the lines. (Drainage lines connected to the drain pump may have clogged with lint or other foreign debris and prevent the F21 from draining to the fault code F21) 6 - Check the pressure switch/water level switch to make sure it is working properly. (To make the pressure switch, remove the power of the washer, remove the top panel, remove 3 screws from the rear washer and the pressure switch on top to the right, and it looks like a small plate with a small hose connector on the side) 7 - After cleaning out the drain filter, after checking the pressure switch (if any), the drain lines, and checking the wiring harness, you can put panel back, apply it back to the washer to try to wash. Run a wash. If the test wash is successful and you do not see error code F21, you have fixed the washer. (If the F21 error code reappeates afer you have done the above, you need to remove the power, remove the panel, remove the drain pump from the washer and find out if the drain pump is internally, mechanically defective or electrically defective) If after troubleshooting and assume the drain pump is the problem, make sure the drain pump gets power when the drain cycle starts. The drain pump should be getting 120vac voltage while pumping. If so, it may seem as if the drain pump is not working, but in fact it may be that the control board is faulty and does not send energy to the drain pump after changing the water filter?
