Calm wind. Cloudy tonight, low around 24. Calm wind. Light snow before 1pm SundayA chance, then a slight chance of snowfall between 1pm and 3pm. Mostly cloudy, highs near 37. Calm wind being about 6 mph south. There's a 30% chance of precipitation. Little or no accumulation of snow is expected. Sunday Night, mostly cloudy, lows around 27. Calm wind. MondayParli sunny, 41 near highs. Light southwest wind. Monday NightMostly cloudy, 31.TuesdayCi around a low sunny, 42.Tuesday NightMostly clear near high, 25.Wednesday Low around sunny with cold, high near 42.Wednesday NightMostly cloudy, low around 32.ThursdayA chance of rain. Mostly cloudy, near 53 highs. There's a 50% chance of precipitation. Thursday Night, the possibility of a life. Mostly cloudy, lows around 30. There's a 50% chance of precipitation. Christmas DayA chances of rain and snowfall. Partly sunny, high near 39. There's a 30% chance of precipitation. Millersville, PA Loading hourly weather data for the next 48 hours. Please wait... With 25°F 30.36inBarometer 72% Nem North 0.0mphWind Fair, Haze has operated the world's largest and most comprehensive weather observation, lightning detection and climate networks for over 20 years. It's ours right now. Data Smarts iot promise to present. By integrating our hyper-local weather data with smart home-connected devices, we've been predicting predictive energy efficiency for homeowners and Utilities companies. Colors are different echo densities (reflectivity) measured in dBZ (Z decibels) during each height tone. Reflectivity (determined by the letter Z) covers a wide range of signals (very weak very strong). That is, a more suitable number for calculations and comparison, a decibel (or logarithmic) scale (dBZ), is used. DBZ values increase as the power of the signal returning to radar increases. Each reflective image you see contains two color balances. A scale (far left) represents dBZ values when the radar is in outdoor mode (dBZ values between -28 and +28). The other scale (near left) represents dBZ values when the radar is in precipitation mode (dBZ values from 5 to 75). Note that colors of all scales remain the same in both modes of operation, only values change. The dBZ value depends on the mode in which the radar was located at the time the image was created. The scale of dBZ values is also related to precipitation intensity. Typically, light rain occurs when the dBZ value reaches 20. The higher the DBZ, the stronger the rain rate. Depending on the type of weather that occurs and the region of the U.S., forecasters use a series of rain ratios associated with dBZ values. These values are precipitation forecasts per hour with the amount of precipitation that is updated in each unit and has been collected over time. Hail energy is a good reflector and will return very high dBZ values. Steps are being taken to prevent these high dBZ values from being converted into precipitation, as hail can cause rainfall forecasts to be higher than actually occurring. The time period when the sun is no more than 6 degrees below the horizon at sunrise or sunset. The horizon must be clearly defined, and the brightest stars should be visible in good atmospheric conditions (i.e. moonlight or other lights). You still need to be able to continue with ordinary outdoor activities. The time period when the sun is 6 to 12 degrees below the horizon. The horizon is well defined, and the outline of objects can be seen without artificial light. No ordinary outdoor activities are currently possible without extra lighting. The time period when the sun is 12 to 18 degrees below the horizon. The sun does not contribute to the light of the sky before this time of morning or after this time in the evening. At the beginning of astronomical twilight in the morning and at the end of the astronomical twilight in the evening, the sky lighting can be very dimmed and Civil Sunset time minus Civil Sunrise time. Real Sunset time minus Real Sunrise time. The change in the length of daylight between today and tomorrow is also listed when available. Available.
